## Preface

Research in Natural Language Processing (NLP) has taken a noticeable leap in recent years. The tremendous growth of information on the web and its easy access has stimulated a large interest in the field. India, with multiple languages and continuous growth of Indian language content on the web, makes a fertile ground for NLP research. Moreover, the industry is keenly interested in obtaining NLP technology for mass use. Internet search companies are increasingly aware of the large market for processing languages other than English. For example, search capability is needed for content in Indian and other languages. There is also a need for searching content in multiple languages, and making the retrieved documents available in the language of the user. As a result, a strong need is being felt for machine translation to handle this large instantaneous use. Information Extraction, Question Answering Systems, and Sentiment Analysis are also showing up as other business opportunities.

These needs have resulted in two welcome trends. First, there is a much wider student interest in getting into NLP at both postgraduate and undergraduate levels. Many students interested in computing technology are getting interested in natural language technology, and those interested in pursuing computing research are joining NLP research. Second, the research community in academic institutions and government funding agencies in India have joined hands to launch consortia projects to develop NLP products. Each consortium project is a multi-institutional endeavour working with a common software framework, common language standards, and common technology engines for all the different languages covered in the consortium. As a result, it has already led to the development of basic tools for multiple languages that are interoperable for machine translation, cross-lingual search, handwriting recognition, and OCR.

In this backdrop of increased student interest, greater funding, and most importantly, common standards and interoperable tools, there has been a spurt in research in NLP on Indian languages whose effects we have just begun to see. A great number of submissions reflecting good research is a heartening matter. There is an increasing realization to take advantage of features common to Indian languages in machine learning. It is a delight to see that such features are not just specific to Indian languages but to a large number of languages of the world, hitherto ignored. The insights so gained are furthering our linguistic understanding and will help in technology development for hopefully all languages of the world. For machine learning and other purposes, linguistically annotated corpora using the common standards have become available for multiple Indian languages. They have been used for the development of basic technologies for several languages. A larger set of corpora are expected to be prepared in the near future.

These conference proceedings contain papers selected for presentation in technical sessions of ICON-2021. We are thankful to our excellent team of reviewers from all over the globe who deserve full credit for the hard work of reviewing the high-quality submissions with rich technical content. From 204 submissions, 78 papers were selected, 51 long papers, 27 short papers, 2 doctoral consortium papers, representing a variety of new and interesting developments, covering a wide spectrum of NLP areas and core linguistics. Besides presentations, the conference also hosted 8 tutorials, 4 workshop, 2 shared tasks, and 3 system demonstrations.

We are deeply grateful to Prof. Josef van Genabith from DFKI and Saarland University (Germany), Prof. Philip Resnik from University of Maryland (USA), Prof. Rada Mihalcea from University of Michigan (USA) and Dr. Louis-Philippe Morency from Carnegie Mellon University (USA) for giving the keynote lectures at ICON-2021.
