

A Model Learning

Figure 1 plots the RMSE and MAE scores against the number of learning iterations for LRMM on datasets. The figure confirms the conclusion from Chai and Draxler (2014) that RMSE is more stable than MAE.

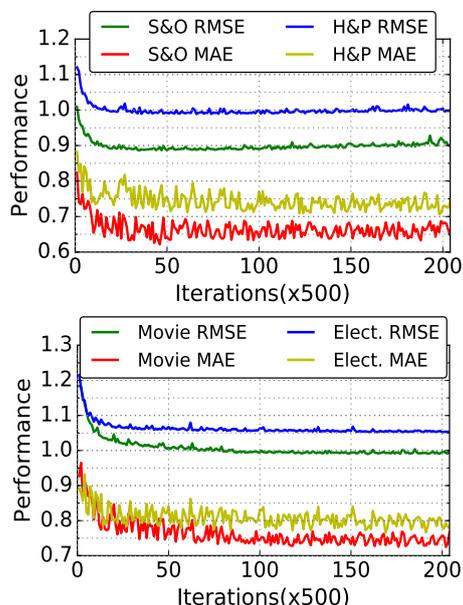

Figure 1: Changes of RMSE and MAE performance when number of iterations increases.

B Exemplary Rating Predictions

Table 1-4 present the randomly selected rating prediction examples on the test dataset for given user-item pairs. Table 1 and 2 give examples of test dataset of “S&O” and “H&P”. The models were trained with corresponding training datasets. Table 3 and 4 give examples of test dataset of “S&O” and “H&P”. But the models were trained with “Electronics” and “Movie” datasets. cross-domain adaptation strategy is utilized. The best prediction is in **blue** and the worst prediction is in **red** and symbols present:

- **T**: ground-truth rating score for a given user-item pair.
- **+F**: prediction with all modalities user review text (**U**), item review text (**O**), item metadata (**M**) and item image (**V**).
- **-U**: prediction with dropping user review text, this leads to *user-based cold-start* problem.
- **-O**: prediction with dropping item review text, this leads to *item-based cold-start* problem.

- **-M**: prediction with dropping item metadata.
- **-V**: prediction with dropping item image.

In Table 1-4, the users and items are presented with their corresponding user and item ID directly.
