

# Numeracy for Language Models: Evaluating and Improving their Ability to Predict Numbers

**Georgios Spithourakis, Steffen Petersen, Sebastian Riedel**

# Literate Language Models

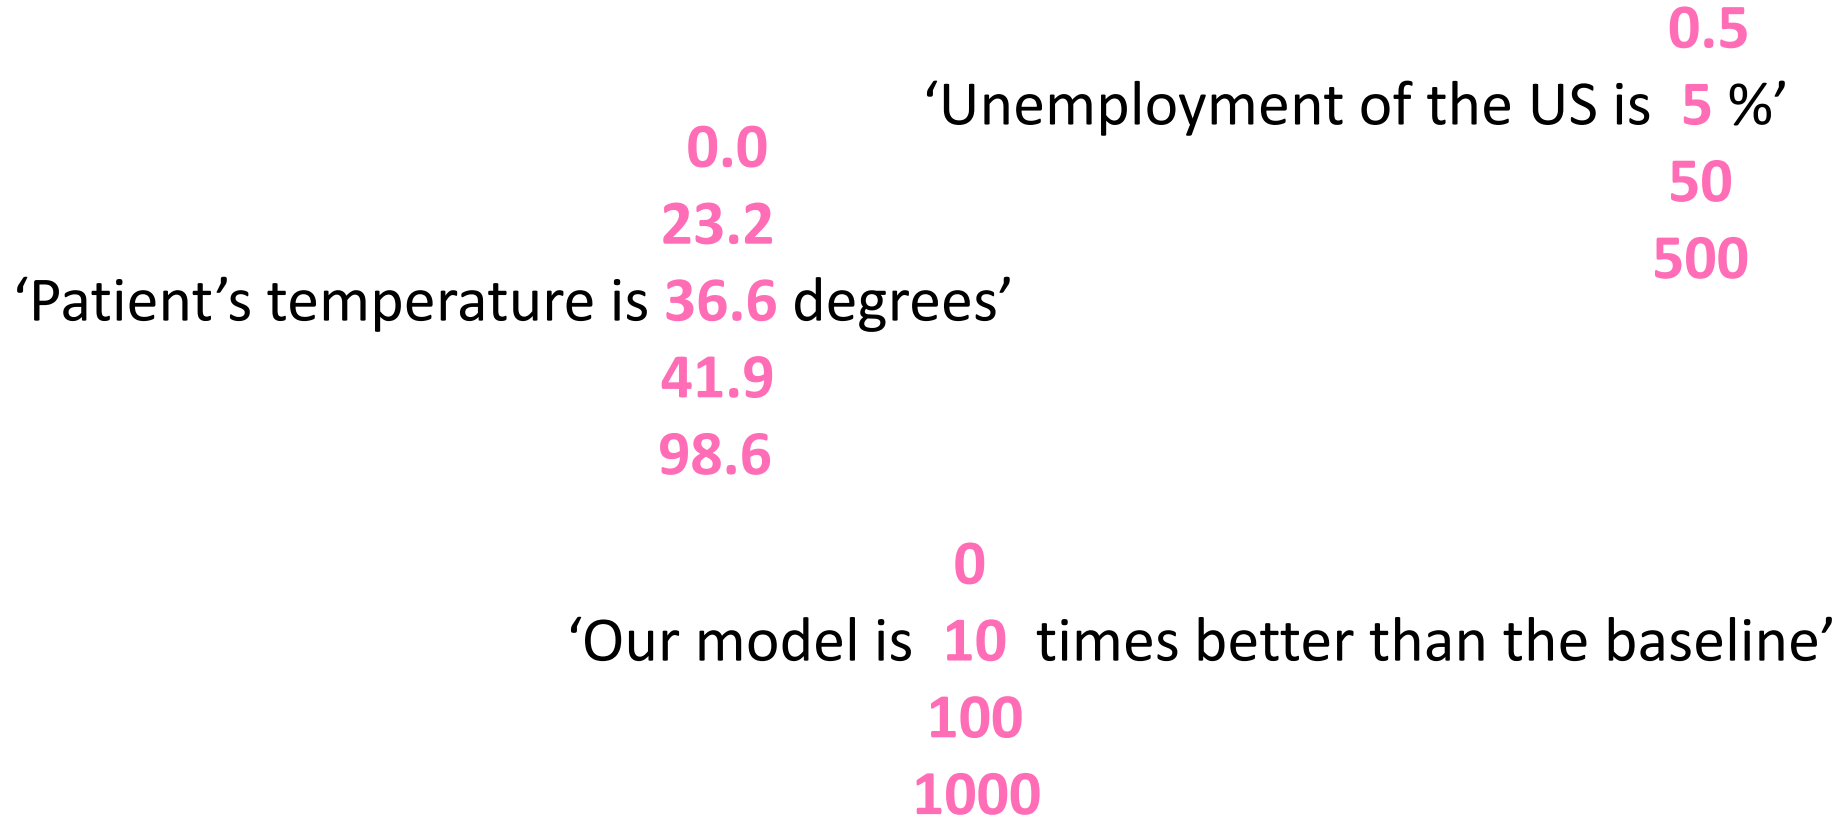

# Numerate Language Models

$P_{LM}(text)$

'John is 0 m tall' 'John is 1.7 m tall' 'John is 2 m tall' 'John is 999 m tall'

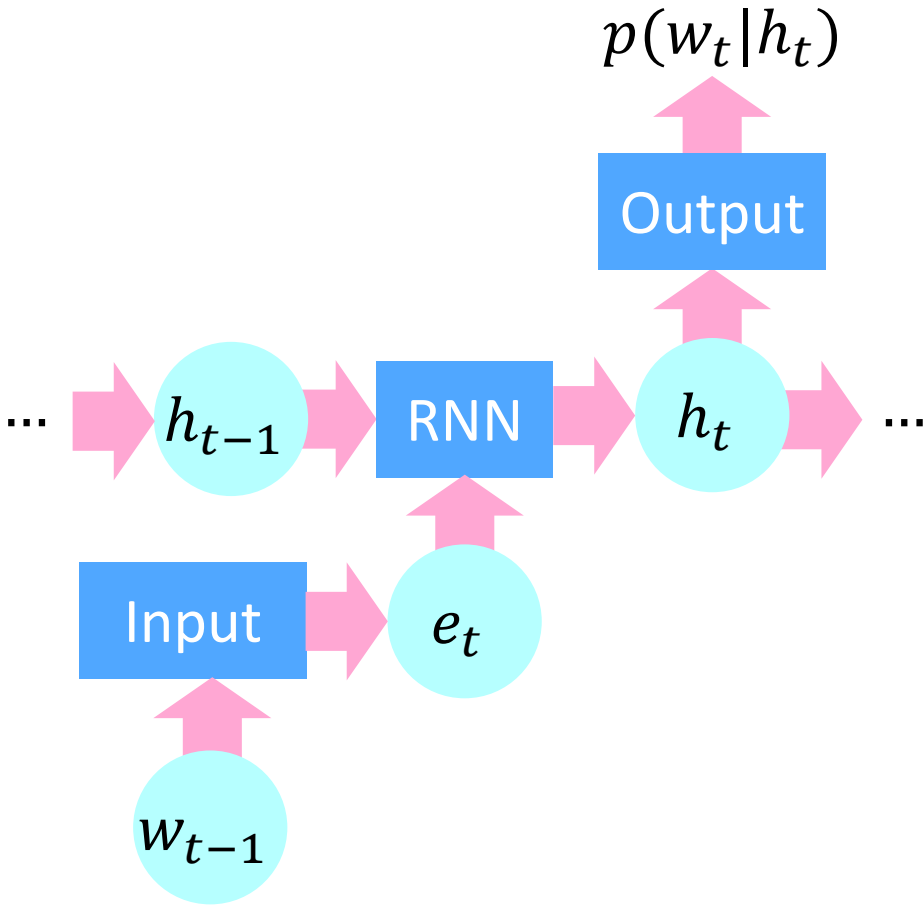

Q1: Are existing LMs numerate?

Q2: How to improve the numeracy of LMs?

Q1: Are existing LMs numerate? 

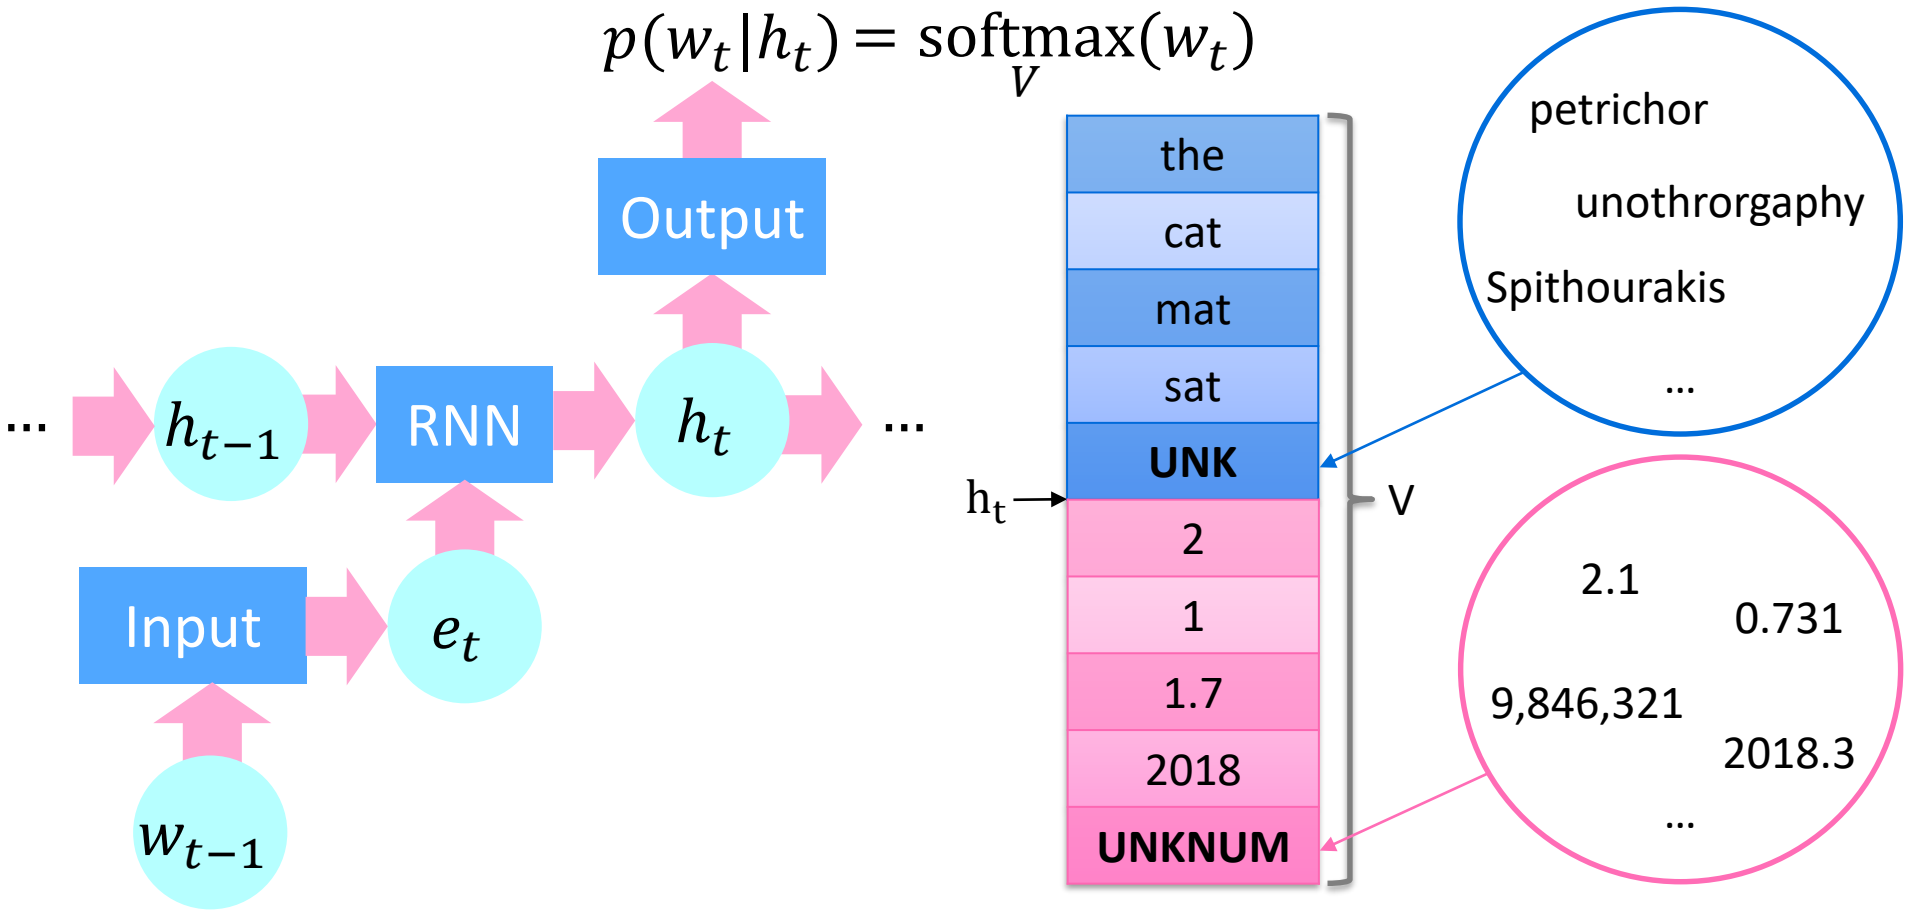

Q2: How to improve the numeracy of LMs?

# A Neural Language Model

# A Neural Language Model

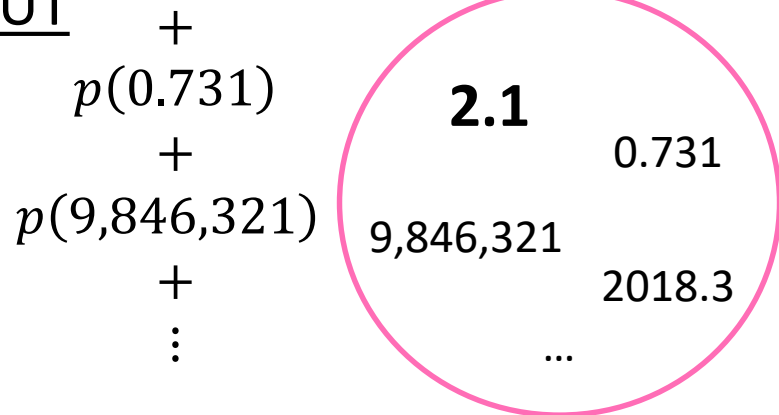

# Evaluation: Adjusted Perplexity

## Perplexity

John is **2.1** m tall

$$p(2.1) = p(\text{UNKNUM})$$

BUT

# Evaluation: Adjusted Perplexity

## Perplexity

John is **2.1** m tall

$$p(2.1) = p(\text{UNKNUM})$$

BUT

$$\begin{aligned} &+ \\ &p(0.731) \\ &+ \\ &p(9,846,321) \\ &+ \\ &\vdots \end{aligned}$$

<b>2.1</b>	0.731
9,846,321	2018.3
...	

## Adjusted Perplexity [Ueberla, 1994]

$$p(2.1) = \frac{p(\text{UNKNUM})}{|\{w \in \text{UNKNUM}\}|}$$

from test data

a.k.a. Unknown-Penalised Perplexity

[Ahn et al., 2016]
