AMTA-94 Demonstration & Company Profile

Systran Translation Systems, Inc. based in La Jolla, California, is the developer of the patented **SYSTRAN** software system, a natural language, fully automatic, intelligent machine translation software program, which provides translators with an unparalleled aid to translation ease, speed, and accuracy.

Celebrating its 26th year of operations, the company was founded in 1968 for the development of the Russian into English language pair for the United States Air Force. Today, we offer twenty-seven (27) combinations of language pairs.

Our numerous users include the Commission of the European Community and the United States Government, as well as multinational organizations such as Xerox Corporation, and others.

Companies with technical documentation, desiring to localize their products for world markets, can also maintain document format integrity in the translated target language, while reducing overall translation costs and shrinking their time to market window - a significant advantage to the user over their competition.

The Windows® version of SYSTRAN will be demonstrated at the AMTA '94 Conference.

SYSTRAN is a self-supporting program, which can be seamlessly integrated with most desktop publishing software systems, such as Interleaf, FrameMaker, GlobalView, and other SGML-compatible packages, as well as major word processing software such as Microsoft Word and WordPerfect.

Our talented team of highly skilled specialists can provide any combination of the following services:

a) Development of new and/or enhancement of existing language-pairs.

b) Licensing of SYSTRAN software, and systems integration within any existing document management environment.

c) Complete localization services in cooperation with well established translation agencies.

d) Consulting services relating to Computational Linguistics projects.

For any additional information, please do not hesitate to contact us directly.
