Abstract

While open-source vision-language models perform well on simple question-answering, they still struggle with complex questions that require both perceptual and reasoning capabilities. We propose LATTE, a family of vision-language models that have LeArned to Think wiTh vision spECialists. By offloading perception to state-of-the-art vision models, our approach enables vision-language models to focus solely on reasoning over high-quality perceptual information. To train LATTE, we synthesize and filter a large dataset of 273K multi-modal reasoning traces over perceptual outputs of vision specialists. LATTE trained on this data achieves significant 4-5% gains over baselines across 6 benchmarks covering both perception and reasoning abilities. Ablation studies reveal that the effectiveness of multi-modal reasoning traces depends on the data sources, formats, and quality of thoughts.

1 Introduction

The landscape of real-world vision-language tasks is vast, spanning from basic visual question answering (Antol et al., 2015), fine-grained object recognition to complex multi-step geometric reasoning (Hu et al., 2024a). These tasks demand both perception and reasoning. For instance, a user might photograph a gas price panel and ask how much fuel they can afford within a given budget (Figure 1). Solving this requires a model with strong perception—localizing prices via OCR—and multi-step reasoning to compute the answer. While proprietary models like GPT-4o excel due to extensive data and model size scaling, smaller open-source models still struggle (Ma et al., 2024).

To narrow the gap between large proprietary models and smaller open-source counterparts within a reasonable budget, researchers have explored distilling perception and reasoning from

larger vision-language models (Shao et al., 2024; Xu et al., 2025) or specialized vision models (Hu et al., 2024b). Despite these efforts, open-source models continue to lag behind.

We argue that the primary reason for this lag is the perception limitations of small vision-language models. While open-source language models have largely caught up with their proprietary counterparts (Lambert et al., 2024; Bi et al., 2024), vision-language models have yet to master heterogeneous vision capabilities. The computer vision community has historically tackled these capabilities separately—e.g., DepthAnything (Yang et al., 2024) for depth estimation and GroundingDINO (Liu et al., 2023d) for object recognition—while unified models still lag behind (Lu et al., 2024a). Similarly, the human brain dedicates distinct regions to categorical recognition (ventral stream) and spatial reasoning (dorsal stream) (Goodale and Milner, 1992), with the reasoning and language-processing frontal and temporal lobes occupying a different volume (Keller et al., 2012). By contrast, vision-language models remain heavily skewed toward language, treating visual encoders as an afterthought (Deitke et al., 2024).

We depart from the *learning to perceive and reason* paradigm to propose a new approach: *learning to reason with vision specialists* (Figure 2). Rather than expecting a small model to master both perception and reasoning, we leverage decades of advancements in computer vision by relying on specialized vision models to provide perceptual information. This allows the vision-language model to focus exclusively on acquiring perceptual information from vision specialists and reasoning over them—enabling it to ‘*see further by standing on the shoulders of giants*.’ Such a paradigm reduces the burden on models to extract low-level perceptual signals, allowing them to concentrate on higher-level reasoning.

To implement this paradigm, we curate high-

*Work done while interning at Salesforce Research

Figure 1: **Example outputs of LATTE vs. SoTA open-source multi-modal language models.** Our LATTE model is able to answer challenging visual questions by reasoning over perceptual information output by vision specialists. It does so by generating a reasoning trace over vision specialists’ outputs and producing a final answer.

quality training data in the form of multi-step reasoning traces that integrate perceptual information from vision specialists. We formulate the multi-step reasoning traces as LATTE-trace, where each step consists of: (1) a *thought* for verbalized reasoning; (2) an *action* to retrieve perceptual information from a specific vision specialist; and (3) an *observation* of the returned data. Since obtaining these traces at scale with human annotators is costly, we develop two data engines for synthetic data generation. First, we leverage GPT-4o’s strong multimodal reasoning and state-of-the-art vision specialists’ precise perception to generate large-scale synthetic reasoning traces across diverse image sources. Second, we generate reasoning traces using Python programs and structured reasoning templates, comparing them against GPT-generated traces to evaluate reasoning quality. In total, we produce over 1M reasoning traces across 31 datasets with GPT-4o and handcrafted programs. We then further apply filtering and mixing techniques and perform extensive experiments with different data ablations.

With the filtered 293K multi-modal reasoning traces, we finetune small 7-8B vision-language models to reason with vision specialists and evaluate our models on 6 benchmarks covering both perception and reasoning skills. We highlight four major takeaways from our experiments: First, learning to reason with vision specialists enables our model to outperform vanilla instruction-tuned baseline by significant margins on both perception and reasoning benchmarks, with an overall average gain of

6.4%. By contrast, the other distillation methods lead to smaller gains or even degradation in the perception performance. Second, our method consistently outperforms the vanilla instruction-tuned baseline by 4 – 5% on average across all benchmarks regardless of model backbones, with staggering performance gains of 10 – 20% on MMVet. Third, through data ablations, we confirm that the quality of LATTE-trace matters more than quantity: our best data recipe consists of only 293K LATTE-trace which GPT-4o generated and answered correctly, and it leads to larger performance gains than other data recipes of larger scales. Finally, programmatically-generated LATTE-trace can hurt model performance as a result of the worse reasoning quality, suggesting that again that high-quality reasoning is crucial to the model’s performance.

To summarize, we highlight three contributions: (1) We introduce a novel and the largest dataset of 293K multi-modal reasoning traces that cover 31 diverse data sources and include both single- and multi-image questions as well as image-text interleaved traces; (2) We demonstrate the effectiveness of our multi-modal reasoning data and showcase sizable performance gains over baselines on 6 benchmarks through extensive experiments; (3) Finally, our ablation studies reveal new insights into what matters in multi-modal reasoning data. We will release all artifacts publicly.

2 Related work

We contextualize our work on multi-modal language models and multi-modal tool use.

Figure 2: **Overview.** We propose LATTE: learning vision-language models to think with vision specialists via synthetic multi-modal reasoning traces.

Multi-modal language models. Recently, there have been many advances on open-source multi-modal models (Awadalla et al., 2023; Chen et al., 2023; Liu et al., 2023b,a, 2024; Dai et al., 2024; Li et al., 2022, 2023b; Deitke et al., 2024). These efforts include training multi-modal models to take in multiple images, engage in multi-turn conversations, and even understand videos (Liu et al., 2024; Jiang et al., 2024; Li et al., 2024). For example, LLaVA-Next achieves strong multi-image understanding through large-scale interleaved visual instruction tuning with M4-Instruct (Liu et al., 2024). Similarly, Mantis introduces a new large-scale multi-image instruction tuning dataset Mantis-Instruct for multi-image training (Jiang et al., 2024). These efforts pave the foundation for our work on learning vision-language models with image-text interleaved reasoning traces.

Multi-modal tool-use. Recently, there is growing interest in training multi-modal language models to be better at tool use (Liu et al., 2023c; Qi et al., 2024; Shao et al., 2024). LLaVa-Plus first shows the possibility of training a multi-modal model to use vision specialists (Liu et al., 2023c). Visual Program Distillation distills tool-use and reasoning abilities into a multi-modal model with chain-of-thought (CoT) data obtained from programs (Hu et al., 2024b). Similarly, Visual CoT introduces a new synthetic CoT dataset for training multi-modal models for enhanced reasoning (Shao et al., 2024). More recently, LLaVa-CoT integrates both perception and reasoning from GPT-4o (Xu et al., 2025). Another closely related work CogCoM identifies 6 useful manipulations and trains multi-modal models with synthetic chain-of-manipulation (CoM) data (Qi et al., 2024). Nonetheless, the manipulations are limited, and the authors only experiment with 70K CoM data.

Although these works demonstrate effectiveness, the proposed reasoning datasets are limited in scale and diversity, and none contains multi-image questions or includes images in the reasoning chains (Appendix A Table 9). To complement existing works, we introduce a new large-scale dataset of 293K multi-modal interleaved reasoning traces that cover 31 data sources and include both single-image and multi-image questions.

3 LATTE: Learning to Think with Vision Specialists

Our goal is to train vision-language models to reason about complex multi-modal tasks with the help of vision specialists. To train such models, we need reasoning traces that involve (1) invoking vision specialists and (2) reasoning over their outputs. We refer to such data as LATTE-trace. We define a LATTE-trace $\mathcal{T}$ as a sequence of steps S_i , where each step consists of thought t_i , action a_i and observation o_i :

$$\mathcal{T} = (S_0, S_1, \dots, S_n) = (S_i)_{i=0}^n \quad (1)$$

$$S_i = (t_i, a_i, o_i), t_i \in L, a_i \in A \quad (2)$$

where L represents language space, and A is the action space consisting of vision specialists. The model only generates t_i and a_i , which the training loss is applied on, whereas o_i is obtained from the vision specialists.

Action space. The action space A of our model consists of vision tools that are either specialized vision models or image processing tools. Concretely, these include OCR (JadedAI, 2025), GETOBJECTS (Zhang et al., 2023), LOCALIZEOBJECTS (Liu et al., 2023d), ESTIMATEOBJECTDEPTH, ESTIMATEREGIONDEPTH (Yang et al., 2024), DETECTFACES (Li et al., 2019), CROP, ZOOMIN,

Figure 3: **Data generation.** We illustrate our model-based data generation (top) and programmatic generation (bottom) pipelines.

GETIMAGETOTEXTSIMILARITY, GETIMAGETOIMAGESIMILARITY, GETTEXTTOIMAGESIMILARITY (Radford et al., 2021). Inspired by prior works (Hu et al., 2024a; Gupta and Kembhavi, 2022; Ma et al., 2024), we include a few additional tools to help with reasoning: QUERYLANGUAGEMODEL, QUERYKNOWLEDGEBASE, CALCULATE, and SOLVEMATHEQUATION. We also include TERMINATE as a tool for the model to output a final answer in the same format. See the Appendix D for all tools’ implementation details.

3.1 LATTE-trace generation

We generate synthetic LATTE-trace data with two automatic approaches: Model-based generation and Programmatic data generation.

Model-based generation. This pipeline consists of three steps (Figure 3 top):

1. GENERATE. First, we leverage images and QA examples in existing visual instruction tuning datasets and generate LATTE-traces to solve the questions with GPT-4o (2024-08-06). We include diverse questions on both single-image and multi-image examples from two large-scale instruction tuning datasets, Cauldron and Mantis-Instruct (Jiang et al., 2024; Laurençon et al., 2024). We feed the images and questions to GPT-4o and prompt it to answer the questions by following a LATTE-trace or just CoT when it is not nec-

essary (e. g. , the question is straightforward) or not helpful (e. g. , the question requires domain-specific knowledge) to call specialized vision tools (Figure 3). We adopt ReAct-style prompting with JSON-format for calling the vision specialists and provide detailed instructions and examples in the prompt (Yao et al., 2023). All prompts are in the Appendix C.

2. VERIFY. Second, we verify GPT-4o’s generated answers against the ground-truth. We force GPT-4o to always end with TERMINATE(answer) and compare its prediction to the ground-truth. If the final answer is correct, we move this LATTE-trace to the next stage. Otherwise, we convert this example into the direct answer (Direct) format with the ground-truth (Figure 3).

3. PARSE. Finally, we check the JSON syntax of each step of the LATTE-trace. Similar to the previous stage, we again keep the LATTE-traces free of errors and turn the others into the Direct format with ground-truth answers.

Programmatic data generation. In addition to distilling reasoning from proprietary models, we implement a programmatic data generation engine for synthesizing LATTE-traces (Figure 3 bottom) and experiment with these data. This pipeline involves two steps:

1. ANNOTATE. First, we gather existing dense annotations of images. We adopt Visual Genome

Figure 4: **Distribution of data formats and sources.** We visualize the frequency of data formats (i.e. LATTE-pos/neg, and CoT-pos/neg, pos = correct final answers, neg = incorrect) in the original GPT-4-generated data and in our training data (i.e. LATTE-trace, CoT, or Direct) across all data sources. We also highlight the LATTE-useless (i.e. $\% \text{ of CoT-pos} - \text{LATTE-pos} > 10$ or $\% \text{ of LATTE-neg} - \text{LATTE-pos} > 10$) vs. LATTE-useful datasets.

(VG) as it contains rich human annotations of objects, attributes, and relationships of the images. In addition, we obtain depth maps of the VG images with Depth-Anything-v2 (Yang et al., 2024).

2. GENERATE. Next, we programmatically generate both the QA pairs and the corresponding LATTE-traces with manually written templates and dense image annotations. We reuse the pipeline from (Zhang et al., 2024a,b) to generate QA pairs that cover various vision capabilities such as counting and spatial understanding (See Appendix E.2 for details). To generate LATTE-traces, we define templates for thoughts, actions, and observations across all steps and fill in the templates with the collected annotations. In particular, we manually design five thought templates for each action and randomly sample one during generation. As for actions, we manually select the specialized vision tools for each type of questions (e.g., ESTIMATEOBJECTDEPTH for questions on objects’ relative depths, and LOCALIZE for object counting questions, etc.) and compose templates with them.

3.2 Data filtering and mixing

We develop 3 filtering/mixing techniques, where we vary the distribution of: (1) data formats; (2) data sources; and (3) model- vs. program-generated reasoning traces.

Data format. Model-generated data can be categorized into two formats: LATTE-trace or CoT examples (Figure 3). Additionally, they are further grouped into LATTE-trace/CoT-pos and LATTE-trace/CoT-neg examples where the final answers are correct and wrong respectively (Figure 4). Note that we convert both LATTE-trace-neg and CoT-neg examples into the Direct format with ground-

truth answers (Figure 3) so the final data format is one of LATTE-trace, CoT, and Direct.

Data source. We also perform filtering based on data sources as Cauldron and Mantis-Instruct cover a wide range of tasks, some of which benefit more from vision specialists than others. To this end, we define LATTE-useless datasets as the ones where GPT-4o either decides to output CoT much more often than LATTE-trace (i.e. $\% \text{ of CoT-pos} - \text{LATTE-trace-pos} > 10$), or reaches wrong answers much more frequently than correct ones when using LATTE-trace (i.e. $\% \text{ LATTE-trace-neg} - \text{LATTE-trace-pos} > 10$) (Figure 4). The remaining datasets are considered LATTE-useful datasets.

Program-generated data. As the distribution of actions in model-generated data is imbalanced, with a couple of actions such as GETOBJECTS and OCR dominating the dataset, we also try increasing action diversity by adding programmatic traces with underrepresented actions such as LOCALIZEOBJECTS, and ESTIMATEREGIONDEPTH.

4 Experiments

We perform extensive experiments with small 7-8B multi-modal models and various data recipes on 6 benchmarks to study two questions: (1) do LATTE-traces improve small vision-language models’ performance on both perception and reasoning VQAs? (2) what matters in LATTE-traces?

Models. We adopt models with multi-image support as our reasoning traces include multiple images. For most experiments, we use Mantis-8B-SigLIP-LLaMA-3 as the base model. We additionally experiment with Mantis-8B-CLIP-LLaMA-3, and LLaVA-OneVision-7B (Qwen2-7B and SigLIP) to showcase our method’s generalizability.

Table 1: **LATTE vs. Vanilla IT with Different Models.** LATTE leads to performance gains over Vanilla IT regardless of the base models. The gains are 4-5% on average across all 6 benchmarks and up to 17% on MMVet.

Language / Vision	Starting checkpoint	Method	Perception				Perception + Reasoning				Overall
			CV-Bench	BLINK	RealWorldQA	Avg	Math Vista	MMStar	MMVet	Avg	Avg
LLaMA3-8B / CLIP	Mantis	Vanilla IT	52.6	45.8	52.3	50.2	33.1	36.7	28.9	32.9	41.6
		LATTE	56.9	49.6	51.1	52.6	36.6	40.8	45.2	40.8	46.7 (+5.1)
LLaMA3-8B / SigLIP	Pretrained	Vanilla IT	52.3	43.7	51.8	49.3	31.1	40.5	33.0	34.9	42.1
		LATTE	<u>57.2</u>	47.8	53.7	52.9	34.9	44.6	45.2	41.6	47.2 (+5.1)
	Mantis Instruct-tuned	Vanilla IT	50.6	46.7	54.8	50.7	36.2	40.7	29.7	35.5	43.1
		LATTE	51.7	47.3	56.1	51.7	38.9	45.1	<u>50.0</u>	<u>44.7</u>	48.2 (+5.1)
Qwen2-7B / SigLIP	LLaVa-OV Stage 1.5	Vanilla IT	56.8	<u>50.3</u>	<u>57.8</u>	<u>55.0</u>	<u>42.4</u>	<u>50.1</u>	39.3	43.9	<u>49.5</u>
		LATTE	60.2	52.6	61.1	58.0	46.9	50.8	50.9	51.2	53.8 (+4.3)

Table 2: **LATTE vs. Distillation Baselines.** LATTE brings substantial gains over the Vanilla IT baseline on both perception and perception + reasoning benchmarks, whereas VPD and LLaVa-CoT result in smaller gains. LLaVa-CoT even suffers from performance drop in perception tasks. All models were trained with 98K data.

Method	Perception				Perception + Reasoning				Overall
	BLINK	CV-Bench	RealWorldQA	Avg	MathVista	MMStar	MMVet	Avg	Avg
Vanilla IT	<u>44.1</u>	<u>49.2</u>	41.4	44.9	31.0	39.7	27.8	32.8	38.9
VPD	41.6	48.8	44.8	<u>45.1 (+0.2)</u>	33.0	41.1	32.8	35.7 (+2.8)	<u>40.4 (+1.5)</u>
LLaVa-CoT	42.2	40.4	38.0	40.2 (-4.7)	<u>36.7</u>	44.6	<u>40.2</u>	<u>40.5 (+7.7)</u>	<u>40.4 (+1.5)</u>
LATTE	46.4	54.0	<u>42.0</u>	47.5 (+2.6)	36.9	<u>44.2</u>	47.9	43.0 (+10.2)	45.2 (+6.4)

Baselines. We compare LATTE to three types of baselines: (1) vanilla instruction-tuning (IT): instruction-tuning with only direct answers; (2) distillation methods that distill both perception and reasoning from larger models into smaller models, including VPD (Hu et al., 2024b)¹, LLaVa-CoT (Xu et al., 2025), and VisCoT (Shao et al., 2024)²; For fair comparison, we train our models and baselines with the same base model, the same hyperparameters, and the same number of examples; (3) multi-modal agents that use tools at inference time, including LLaVa-Plus (Liu et al., 2023c) and CogCoM (Qi et al., 2024).

Training details. We finetune models starting from checkpoints at different stages – pretrained and instruction tuned for Mantis-8B-SigLIP-LLaMA-3, and stage 1.5 for LLaVA-OneVision-7B – to investigate if and where LATTE-traces bring gains. We adopt the hyperparameters from (Liu et al., 2024; Jiang et al., 2024) and fine-tune both the language model and the projector with learning rate = $1e-5$ for 1 epoch with either NVIDIA A100s 40GB or H100s 80GB. We additionally perform hyperparameter tuning with LLaVA-OneVision-7B and include this result in the Appendix F.

¹As VPD is close-sourced, we reproduce their data by converting LATTE-traces into CoTs in VPD’s format.

²Since VisCoT only has reasoning steps for one data source GQA, training with its data leads to much worse performance. We include its results in the Appendix B.3.

Evaluation setup. We select 6 VQA benchmarks covering both perception and reasoning. The perception-focused benchmarks include RealWorldQA, CV-Bench and BLINK (Tong et al., 2024; Schwenk et al., 2022; Fu et al., 2024; Li et al., 2023a). We also include 3 benchmarks that additionally test reasoning capabilities: MathVista, MMStar, and MMVet (Lu et al., 2024b; Chen et al., 2024a; Yu et al., 2024). We adapt VLMEvalKit (Duan et al., 2024) for our evaluation, where an LLM judge (i.e. GPT-4-turbo) is used to score predictions between 0 and 1 compared to the groundtruth short answers for open-ended questions. Additional details are in Appendix G.

4.1 Do LATTE-traces improve models’ performance on both perception and reasoning VQAs?

LATTE beats Vanilla IT on average across all benchmarks regardless of the base model and checkpoint, with significant gains of up to 17% on MMVet. We fine-tune 3 different multi-modal models with all 293K LATTE-traces starting from different checkpoints. We observe that our method leads to consistent gains of 4-5% in the model’s average accuracy across 6 benchmarks compared to the baselines instruction-tuned with the same examples in the Direct format (Table 1). We note that our method results in staggering gains of up

Figure 5: **LATTE vs. Distillation Baselines across Training Data Scales.** LATTE leads to consistent gains on perception and reasoning benchmarks over the Vanilla instruction-tuned baseline across varying training data sizes – 98K, 200K and 293K – and the gains are larger than VPD’s. LLaVa-CoT only has 98K data.

Figure 6: **Ablations on Data Formats.** 293K LATTE-traces lead to the greatest gains over Vanilla IT and the highest overall performance. Adding either CoT or Direct doesn’t bring additional gains despite the increased size.

to 17% on MMVet, which covers a wide range of perceptual and reasoning capabilities.

LATTE leads to substantial gains over vanilla instruction-tuning on both perception and reasoning benchmarks, whereas distillation baselines result in smaller gains or even degradation on some perception tasks. We find that learning to reason with vision specialists enables our model to achieve consistent gains on perception-focused VQA benchmarks as well as benchmarks that require both perception and reasoning, with average gains of 2.6% and 10.2% respectively (Table 2). By contrast, both distillation baselines VPD and LLaVa-CoT bring much smaller gains, with an average of 1.5% across all benchmarks, compared to ours (6.4%). Further, we observe that the same trend holds as we scale the training data size from 98K to 200K and 293K, where our method consistently brings larger gains on both perception and perception + reasoning benchmarks (Figure 5). Interestingly, LLaVa-CoT even hurts the model’s performance on perception benchmarks, even though it increases the performance on the perception + reasoning benchmarks (Table 2). This result suggests that GPT4-o might still be inferior to vision specialists on some perception tasks, as LLaVa-CoT distills purely from GPT4-o.

LATTE scores higher on MathVista and

Table 3: **LATTE vs. Multi-modal Agent Baselines.** Training with LATTE-traces leads to much larger gains.

Model	Data size	Base model → Finetuned model	
		MathVista	MMVet
LLaVA-Plus	158K	—	32.5 → 35.0 (+2.5)
CogCoM	70K	34.8 → 35.7 (+0.9)	45.9 → 46.1 (+0.2)
LATTE	98K	32.7 → 36.9 (+4.2)	34.4 → 47.9 (+13.5)
LATTE	293K	32.7 → 38.9 (+6.2)	34.4 → 50.0 (+15.6)

MMVet than multi-modal agent baselines do, and LATTE-traces bring larger gains to the base model. We see in Table 3 that LATTE achieves higher accuracies on MathVista and MMVet. Moreover, LATTE-traces bring much larger gains to the base model than LLaVa-Plus and CogCoM’s data do, despite its comparable size.

4.2 What matters in LATTE-traces?

We perform ablations with LATTE-traces to study what matters in improving models’ performance. For model-generated data, we explore two data filtering techniques on (1) data formats and (2) data sources (Figure 4).

Data quality matters more than quantity: 293K LATTE-traces lead to higher performance than larger mixtures of LATTE-traces and CoT or Direct. We find that 293K LATTE-traces result in the biggest gain of 5% on average over the baseline across all benchmarks (Figure 6). Adding CoT

Table 4: **Ablations on data sources.** Including all sources hurts model’s perception and overall performance while having only LATTE-useful datasets helps.

Data source	Size	Method	Percept.	P. + Reason.	Overall
All datasets	815K	Vanilla IT LATTE	50.7 47.7 (-3.0)	34.7 35.1 (+0.4)	42.7 41.4 (-1.4)
LATTE-useful datasets	566K	Vanilla IT LATTE	46.3 46.8 (+0.5)	33.3 35.6 (+2.3)	39.8 41.2 (+1.4)

examples results in a smaller gain of 2.6%, even though the training data size almost doubles (Figure 6). On the other hand, combining LATTE-trace and Direct examples hurts the model’s performance compared to LATTE-traces only, especially on the perception tasks (Figure 6). We empirically observe that models trained with a mix of LATTE-traces and Direct examples tend to adopt the Direct format more often (around 70%) at inference time, relying on its own weaker perceptual ability instead of vision specialists’ and thus scoring lower.

Data sources matter too: including all datasets hurts performance while including only LATTE-useful datasets brings gains. Similarly, we see that including only the LATTE-useful datasets – where GPT-4o frequently chooses to use vision specialists and reaches correct final answers – improves the model’s average performance compared to the baseline, while including all data sources doesn’t (Table 4). Again, we see that a smaller set of 566K LATTE-traces leads to better performance than a much larger dataset (815K), implying that data quality matters more than quantity.

Table 5: **Ablations on programmatic LATTE-traces.** We find that training with additional programmatic LATTE-traces doesn’t bring more gains.

M: P	Data format	Size	MathVista	Percept. + Reason.	Overall
—	Direct		31.1	34.9	42.0
0:1	P-traces	293K	17.3	15.9	27.2
1:0	M-traces		34.9	<u>41.6</u>	47.2
1:0.1	+P-traces 29K	322K	33.9	40.1	44.0
1:0.25	+P-traces 73K	366K	38.3	42.1	<u>46.3</u>
1:0.5	+P-traces 147K	440K	<u>36.7</u>	39.7	45.5
1:1	+P-traces 293K	586K	31.0	36.2	43.2

Programmatically generated LATTE-traces can help on a certain benchmark but not overall, likely due to the worse quality of thoughts. We experiment with a mixture of model-generated and programmatic reasoning traces, with ratios ranging from 1:0.1 to 1:1. We find that training with only programmatic LATTE-traces results in large performance drops (Table 5). Similarly, while adding programmatic LATTE-traces can bring gains on some benchmark (e.g. MathVista), it fails to bring over-

all gains despite the increased data size (Table 5). This is likely due to the model’s worse reasoning capability learned from templated thoughts. See more details in Appendix B.2 (Figure 8).

Overall, our experiments suggest that the quality of perceptual information and reasoning are both crucial to improving vision-language models’ performance across diverse VQAs.

4.3 Additional ablations

Table 6: **Ablations on LATTE’s inference setup.** The OCR tool greatly affects model’s performance, while the query LLM tool doesn’t; and increasing the maximum number of tool calls doesn’t help beyond 10.

Method	Percept.	P. + Reason.	Overall
LATTE (max 10 calls)	51.7	43.8	47.8
max 5 calls	51.7	42.8	47.2
max 20 calls	51.6	43.6	47.6
no QUERYLM	52.1	43.5	47.8
OCR with easyocr	51.4	39.9	45.7

What matters in LATTE’s inference setup? In addition to training data, we also perform ablations on LATTE’s inference setups, including tool ablations and tool call number ablations.

First, the tool ablations include (1) excluding the QUERYLANGUAGEMODEL tool, and (2) using EasyOCR (JadedAI, 2025) instead of GPT for OCR. We see that removing QUERYLANGUAGEMODEL leads to no difference in the model’s overall performance (Table 6), suggesting that QUERYLANGUAGEMODEL is not an important tool to the VQA benchmarks in our evaluation. Nevertheless, by using EasyOCR for OCR we do see a large drop in the model’s performance, especially on reasoning-intensive benchmarks such as MMVet due to EasyOCR’s less accurate outputs (Table 6). Still, LATTE is over 2% above the vanilla instruction-tuned baseline on average across all benchmarks.

Second, as we adopt multi-turn conversations for all models with our method, we can vary the number of tool calls at inference time. We set the maximum number of tool calls to 10 by default and experiment with 5 and 20 tool calls. Through this experiment, we see that the model’s scores peak at 10 maximum tool calls, suggesting that 10 tool calls are sufficient in most cases (Table 6).

Do LATTE-traces improve stronger base models? We further ablate on the model backbone, as new and stronger open-source vision-language models come out. Our results using the latest

BLINK	VPD	LLaVA-CoT	LATTE
 Q: How many people are sitting on the bed? Select from the following choices. Options: A. 3, B. 1, C. 2, D. 0	To determine how many people are sitting on the bed, I need to analyze the image. The objects are ['armchair', 'balance', 'couch', 'game', 'game controller', 'girl', 'person', 'living room', 'man', 'play', 'remote', 'scale', 'stand', 'video game', 'Wii', 'Wii controller', 'woman']. The observation indicates the presence of a 'couch' and 'living room', suggesting that people might be sitting on the couch. I will verify this visually. The final answer is C.	<SUMMARY> I will analyze the image to determine the number of people sitting on the bed by examining the visible details and context. </SUMMARY> <CAPTION> The image shows a person standing on a balance board in a living room. In the background, there is a couch with two people sitting on it. </CAPTION> <REASONING> To determine how many people are sitting on the bed, I will focus on the couch in the background. The couch appears to have two people sitting on it, as indicated by their positions and the visible parts of their bodies. </REASONING> <CONCLUSION> C </CONCLUSION>	t: To determine how many people are sitting on the bed, I need to analyze the image. a: Localize(image-0, ["person"]) o: [{"label": 'person', 'bbox': [0.0, 0.52, 0.37, 0.81], 'score': 0.73}, {"label": 'person-2', 'bbox': [0.16, 0.05, 0.94, 0.91], 'score': 0.8}] t: The image shows two people, but only one is sitting on the bed. a: Terminate("B")

Figure 7: **Qualitative analysis.** Example outputs of VPD, LLaVA-CoT vs. LATTE on BLINK.

Table 7: **Ablations on LATTE’s model backbone.** LATTE-traces improve stronger base models too.

Model backbone	Method	Percept.	P. + Reason.	Overall
InternVL3-8B	Vanilla IT	51.5	45.1	46.7
	LATTE	54.1	54.5	52.0
Qwen2.5VL-3B	Vanilla IT	54.3	49.6	50.8
	LATTE	53.4	55.7	55.1
Qwen2.5VL-7B	Vanilla IT	53.7	52.5	52.8
	LATTE	56.9	57.7	57.5

vision-language models – Qwen2.5VL and InternVL3 – as the base models demonstrate that our method improves upon vanilla instruction tuning even with strong base models (Table 7).

4.4 Error Analysis

Where does LATTE perform better than the distillation baselines? We find that LATTE performs better in fine-grained perception tasks such as the counting questions in BLINK, while VPD and LLaVA-CoT tend to hallucinate and make perceptual errors (Figure 7).

Table 8: **LATTE’s Error Types on MMVet.**

Error type	Subtype	%
Tool call	Format	3
	Value	6
Tool result	—	7
Model perception	Not using tools	6
	Irrelevant tools	50
Model reasoning	—	28

What errors does LATTE make? On MMVet, we find that the model’s most frequent error happens when it falls back on its own perceptual ability after deciding not to use tools or finding the vision tools’ outputs irrelevant/not helpful for the question (e. g. movie, arts, or medical questions that require domain knowledge) (Table 8). These numbers suggest that the model’s performance can be improved by diversifying tools and questions in the training

data, and strengthening reasoning.

5 Conclusion

We propose to learn vision-language models to reason with vision specialists. To learn such models, we synthesize a novel large-scale dataset of multi-modal reasoning traces grounded on perceptual information. With this data, we fine-tune small vision-language models and perform extensive experiments. Across 6 benchmarks covering both perception and reasoning, we demonstrate that our model achieves significant gains over vanilla instruction-tuned baselines and other distillation methods in perception and reasoning tasks.

6 Limitations

First, our method requires customized implementations of the specialized vision tools. Second, reasoning with the vision specialists requires additional compute at inference time. Nevertheless, it is becoming a common practice to increase model performance by scaling up test time compute (OpenAI, 2025; Muennighoff et al., 2025). Future work can optimize and enhance the implementations of vision specialists, especially as the computer vision community continues to advance vision models. Additionally, while we try to include the most important tools for general perception and reasoning, other types of VQA e. g. knowledge-intensive ones might benefit from additional tools as suggested in our error analysis. Lastly, due to the limited generalization of supervised finetuning and diversity of the visual world, researchers might need to explore training alternatives (e. g. reinforcement learning) for better generalization or train new models with different vision specialists for other applications (e. g. web navigation) or for other domains (e. g. medical question answering).

A Dataset and model comparison

We summarize the differences between our work and the other multi-modal CoT datasets including ScienceQA, M³COT, Visual CoT, VPD, V*, LLaVa-Plus, LLaVA-CoT, CogCoM in Table 9.

B Additional results

B.1 Additional qualitative examples

We present additional successful outputs of LATTE across both single-image and multi-image examples in Figures 10 and 11 as well as failure cases in Figure 12.

B.2 Qualitative error analysis

Why does adding programmatic LATTE-trace help on MathVista but hurt MMVet performance? We observe that adding programmatic LATTE-trace can result in up to 3% gain on MathVista and 9% drop on MMVet. Upon analysis, we discover that programmatic LATTE-trace improves the general VQA split in MathVista the most by almost 9%. This is because LOCALIZE is helpful for these questions, and our programmatic data includes many LOCALIZE instances that allow LATTE to learn to use it effectively (Figure 8). Conversely, programmatic data hurts LATTE’s performance on MMVet most likely due to the model’s worse reasoning ability as a result of the simple and rigid thoughts generated with templates in our programmatic data (Figure 8).

B.3 Additional quantitative results

We report additional quantitative results of data ablations on Mantis-CLIP in Table 14, where we see the same trends we observe with Mantis-SigLIP: the smallest dataset of 293K LATTE-trace examples leads to the highest absolute performance and gain compared to other datasets with a mix of LATTE-trace, CoT, and/or Direct examples at larger scales.

Visual-CoT Performance. We experimentally compare LATTE to Visual-CoT. We finetune Mantis-LLaVA-Pretrained (LLama3+SigLIP) with Visual CoT and compare its performance with LATTE (Table 10). We use 413K examples where the bounding boxes are valid and within the image. We find that the models trained with Visual CoT data achieve an average accuracy of 39.3% (much lower as Visual CoT’s data are mostly Text/Doc images and contain only bboxes without natural language thoughts) on the benchmarks.

Performance gain with LATTE inference. We compare the model’s performance when trained with a random mix of 293K LATTE-traces and Direct data (1:1) and tested with LATTE format vs. Direct prompt. We find that the model achieves an average of 50.3% when tested following LATTE format vs. 48% with the Direct prompt (Table 11), suggesting that reasoning with vision specialists at inference time improves model’s performance.

Hyperparameter tuning Additional gains can be achieved by tuning the vision encoder, training with a smaller learning rate or for more epochs. Last but not least, our hyperparameter tuning experiments with LLaVa-OV-Stage1.5 suggest that we can further improve the model’s absolute performance by tuning the vision encoder, training with a smaller learning rate and/or for longer epochs (Figure 9).

C Model-based data generation

C.1 Generation prompt

We present the full data generation prompt used in our model-based data generation pipeline in Listing 2.

C.2 Dataset statistics

We present a table with detailed statistics of the LATTE-trace 293K dataset in Table 15.

D Action implementation

Our Python implementation of all actions can be found in Listing 1.

E Programmatic data generation

E.1 QA and action templates

We present the question-answer and corresponding action templates used in our programmatic data generation in Table 16. We design 16 different question templates for both single-image and multi-image examples that cover 5 capabilities: attribute recognition, counting, 2D and 3D spatial understanding, and multi-image understanding.

E.2 Thought templates

We also present the five thought templates in Listing 3 we define for each action, where one of them is randomly sampled and used during generation.

Table 9: **Dataset and model comparison.**

Paper	Dataset					Model	
	Training set size	Data source number	Tool number	Multi-image questions	Multi-modal reasoning chain*	Inference-time use	Multi-tool-image support
Science QA (Saikh et al., 2022)	12.6K	1	✗	✗	✗	✗	✗
M3CoT (Chen et al., 2024b)	7.8K	2	✗	✗	✗	✗	✗
VPD (Hu et al., 2024b)	90K	6	6	✗	✗	✗	✗
LLaVA-CoT (Xu et al., 2025)	100K	10	✗	✗	✗	✗	✗
V* (Wu and Xie, 2024)	206K	3	1	✗	✗	✗	✓

Sample A
Mass of each particle: 44 u
Average particle speed: 830 m/s

Sample B
Mass of each particle: 36 u
Average particle speed: 690 m/s

Q: Compare the average kinetic energies of the particles in each sample. Which sample has the higher temperature? Sample A or sample B?

A: Sample A

t: To determine which sample has a higher temperature, I need to compare the average kinetic energies of the particles in each sample using the formula: $KE = 0.5 * m * v^2$, where m is the mass and v is the velocity. Since both samples have the same number of particles, the sample with the higher average kinetic energy will have the higher temperature.

a: **Calculate**("0.5 * 44 * 830**2")

o: 15155800.0

t: Now, I need to calculate the average kinetic energy for Sample B to compare.

a: **Calculate**("0.5 * 36 * 690**2")

o: 8569800.0

t: The average kinetic energy for Sample A is 15,155,800, and for Sample B is 8,569,800. Since Sample A has a higher average kinetic energy, it has the higher temperature.

a: **Terminate**("Sample A")

Q: Is the trash can empty or full?

A: Empty

t: The image shows a trash bin with a hand placing a bag inside. I need to determine if the trash bin is empty or full.

a: **GetObjects**(image-0)

o: ['bag', 'bin', 'box', 'container', 'dish washer', 'drawer', 'food', 'home appliance', 'person', 'kitchen', 'kitchen counter', 'kitchen sink', 'lid', 'package', 'plastic', 'sink', 'stand', 'woman']

t: The observation indicates the presence of a bag and a bin, but it doesn't specify the contents of the bin. Based on the image, the trash bin appears to be empty as there is no visible trash inside.

a: **Terminate**("empty")

Q: How to cook this dish?

A: This dish is called "Strawberry Rhubarb Pie". This strawberry rhubarb pie is a favorite springtime dessert in our house...Ingredients: 1 cup white sugar, 1/4 cup all-purpose flour...2 tablespoons white sugar...Step 1: Preheat oven to 400 degrees F (200 degrees C)...Step 8: Bake at 400 degrees F (200 degrees C), for 35 to 40 minutes, or until bubbly and brown. Cool on rack.

t: The image shows a pie, likely a strawberry pie. I need to provide a general recipe for cooking a pie.

a: **QueryLanguageModel**("How to cook a strawberry pie?")

o: Cooking a strawberry pie is a delightful process, and here's a simple recipe to guide you:
Ingredients: For the Pie Crust:\n- 2 1/2 cups all-purpose flour\n- 1 cup (2 sticks) unsalted butter, ... 1/4 teaspoon salt\n- 2 tablespoons unsalted butter, cut into small pieces...
t: I have enough information to provide a general recipe for cooking a strawberry pie.

a: **Terminate**("Cooking a strawberry pie involves making a pie crust and filling with strawberries and sugar. Ingredients: For the Pie Crust:\n- 2 1/2 cups all-purpose flour\n- 1 cup (2 sticks) unsalted butter, cold and cut into small pieces...For the Filling:- 5 cups fresh strawberries, hulled and halved\n- 3/4 cup granulated sugar\n-...9. **Fill the Pie:** Pour the filling into the pie crust")

Q: Given the following images of art paintings, use the first image as the reference image, and determine which one of the second or the third image shares the same style as the reference image? Select from the following choices.
A. the second image
B. the third image

t: To determine which image shares the same style as the reference image, I need to analyze the styles of the images.

a: **GetImageToImagesSimilarity**("image-0", ["image-1", "image-2"])

o: {'best_image': 'image-2', 'best_image_index': 1, 'similarity': [0.49, 0.65]}

t: The similarity scores indicate that image-2 is more similar to the reference image than image-1. Therefore, the third image shares the same style as the reference image.

a: **Terminate**("B")

Q: You are a judge in a photography competition, and now you are given the four images. Please examine the details and tell which one of them is most likely to be a real photograph. Select from the following choices.
A. the first image, B. the second image, C. the third image

t: To determine which image is most likely a real photograph, I need to analyze the content and context of each image.

a: **GetObjects**("image-0")

o: ['baseball hat', 'CD', 'dive', 'field', 'floor', 'frisbee', 'game', 'grass', 'person', 'lush', 'man', 'play', 'rugby player', 'tackle']

t: The first image shows a person playing a game, likely a sport, on a field. This suggests it is a real photograph. I will now check the other images.

a: **GetObjects**("image-1")

o: ['ball', 'beach ball', 'frisbee', 'girl', 'jump', 'lake', 'sea', 'play', 'splash', 'throw', 'water', 'woman', 'yellow']

t: The second image shows a person playing in water, likely at a beach or lake, which is also a real photograph. I will now check the third image.

a: **GetObjects**("image-2")

o: ['swimwear', 'bikini', 'bikini top', 'blue', 'girl', 'jump', 'sea', 'water', 'woman']

t: The third image shows a person swimming in water, which is also a real photograph. I will now check the fourth image.

a: **GetObjects**("image-3")

o: ['swimwear', 'catch', 'CD', 'frisbee', 'girl', 'jump', 'lake', 'pink', 'play', 'throw', 'water', 'woman']

t: All four images depict real-life scenes with people engaging in activities like playing sports or swimming. However, the first image shows a person playing a sport on a field, which is a more typical setting for a real photograph compared to the others.

a: **Terminate**("A")

Figure 10: We present additional successful examples of LATTE.

Q: Can the boy reach the highest book?
(A) Yes, (B) No

t: To determine if the boy can reach the highest book, I need to analyze the image for the boy's height and the height of the bookshelf.

a: **LocalizeObjects**(image-0, ["boy", "bookshelf"])

o: [{"label": "boy", "bbox": [0.07, 0.48, 0.18, 0.95], "score": 0.89}, {"label": "bookshelf", "bbox": [0.13, 0.01, 0.32, 0.72], "score": 0.72}]

t: The boy's height is below the bookshelf, indicating he cannot reach the highest book.

a: **Terminate**("B")

Q: What is the total price for a bottle of Merlot and a bottle of Cabernet shown in the image?
A: \$249.98

t: I need to extract the prices of the Merlot and Cabernet from the image to calculate the total price.

a: **OCR**(image-0)

o: Here are the texts from the image: NORTHSTAR MERLOT COLUMBIA VALLEY 3.0 L **139.99**...CHATEAU ST MICHELLE COLD CREEK CABERNET COLUMBIA VALLEY 3.0 L **109.99** ...

t: The prices for the Merlot and Cabernet are \$139.99 and \$109.99, respectively. I can now calculate the total price.

a: **Calculate**("139.99 + 109.99")

o: 249.98

t: The total price for a bottle of Merlot and a bottle of Cabernet is \$249.98.

a: **Terminate**("\$249.98")

Q: I am getting two margherita pizza and one calzone. How much should I pay in total?
A: 25.80

t: I need to extract the prices of the margherita pizza and calzone from the image to calculate the total cost.

a: **OCR**(image-0)

o: The text on the blackboard reads:\n\n**PIZZA**\n\n- Margherita 5.90€\n- Capricciosa 8.50€...Funghi 6.90€\n\n**Calzone 14.00**\n\n**WI-FI FREE inside**

t: The price of a margherita pizza is 5.90€, and the price of a calzone is 14.00€. I need to calculate the total cost for two margherita pizzas and one calzone.

a: **Calculate**("2 * 5.90 + 14.00")

o: 25.8

t: The total cost for two margherita pizzas and one calzone is 25.80€.

a: **Terminate**("25.80€")

Q: How many yellow stars are on a colorful bridge?
A. 4, B. 3, C. 2, D. 1

t: To determine the number of yellow stars on the bridge, I need to analyze the image for stars.

a: **GetObjects**(image-0)

o: ['building', 'car', 'christmas light', 'city', 'city street', 'light', 'night', 'night view', 'tower', 'road', 'street scene']

t: The object detection did not identify yellow stars specifically. I need to visually inspect the image to count the yellow stars on the bridge.

a: N/A

o: N/A

t: I need to visually inspect the image to count the yellow stars on the bridge.

a: **LocalizeObjects**(image-0, "star")

o: [{"label": "star", "bbox": [0.84, 0.56, 0.87, 0.6], "score": 0.56}, {"label": "star-2", "bbox": [0.53, 0.63, 0.56, 0.66], "score": 0.5}]

t: The image shows two stars detected on the bridge. This matches option C.

a: **Terminate**("C")

Q: Can you give a short introduction to this painting?
A: The Arnolfini Portrait (or The Arnolfini Wedding, The Arnolfini Marriage, the Portrait of Giovanni Arnolfini and his Wife, or other titles) is a 1434 oil painting on oak panel by the Early Netherlandish painter Jan van Eyck. It forms a full-length double portrait, believed to depict the Italian merchant Giovanni di Nicolao Arnolfini and his wife, presumably in their residence at the Flemish city of Bruges.

t: I can provide information about the painting based on general knowledge.

a: **QueryKnowledgeBase**("The Arnolfini Portrait")

o: The Arnolfini Portrait (or The Arnolfini Wedding) is an oil painting on oak panel by the Early Netherlandish painter Jan van Eyck, dated 1434 and now in the National Gallery, London. It is a full-length double portrait, believed to depict the Italian merchant Giovanni di Nicolao Arnolfini and his wife, presumably in their residence at the Flemish city of Bruges. (url: https://en.wikipedia.org/wiki/Arnolfini_Portrait)

t: I have enough information to provide a short introduction to the painting.

a: **Terminate**("The Arnolfini Portrait is a full-length double portrait by Jan van Eyck, depicting Giovanni di Nicolao Arnolfini and his wife in their residence at Bruges. It is an oil painting on oak panel, dated 1434, and is now in the National Gallery, London")

Q: What are all the Chinese scene text in the image?
A: 马戈<AND>著<AND>每个人都有自己的困境<AND>但总会被光亮吸引<AND>身不由己地慢慢靠近

t: I need to extract the text from the image to identify the Chinese scene text.

a: **OCR**(image-0)

o: The text in the image is:\n\n马戈 —— 著 \n\n细细密密的光 \n\n每个人都有自己的困境, \n\n却总会被光亮吸引, 身不由己地慢慢靠近

t: The extracted text provides the Chinese scene text from the image.

a: **Terminate**("细细密密的光\n\n每个人都有自己的困境, \n\n却总会被光亮吸引, 身不由己地慢慢靠近。")

Figure 11: We present additional successful examples of LATTE.

Q: From which angle is this image taken?
A. Front, B. Side

t: To determine the angle of the image, I need to analyze the perspective and orientation of the snake.
a: **GetObjects(image-0)**
o: ['branch', 'green', 'log', 'reptile', 'sit', 'snake', 'stool', 'tail', 'tree', 'tree branch', 'tree trunk', 'twig']
t: The image shows a snake from a side view, as the snake's body is visible from the side rather than directly facing the camera.
a: **Terminate("B")**

Q: Is the wind blowing the flag?
A. Yes, B. No

t: To determine if the wind is blowing the flag, I need to analyze the image for signs of movement or distortion in the flag.
a: **GetObjects(image-0)**
o: ['blue', 'flag', 'flag pole', 'fly', 'mast', 'pole', 'sky', 'wave', 'wind']
t: The presence of 'wind' and 'wave' in the detected objects suggests that the flag is indeed being blown by the wind.
a: **Terminate("A")**

Q: Which type of eggs are in the corner of the picture?
A. Quail eggs, B. Chicken eggs

t: To determine the type of eggs in the corner of the image, I need to analyze the visual characteristics of the eggs.
a: **GetObjects(image-0)**
o: ['bakery', 'bread', 'butter', 'table', 'dip', 'dough', 'flour', 'food', 'hummus', 'pastry', 'platter', 'tray', 'type']
t: The object detection did not identify the eggs specifically. However, based on the visual characteristics of the eggs in the image, they appear to be quail eggs due to their small size.
a: **Terminate("A")**

Q: An object is placed at a distance of $1.5f$ from a converging lens of focal length f , as shown. What type of image is formed and what is its size relative to the object? Type/Size
A. Virtual/Larger
B. Virtual/Same size
C. Real/Smaller
D. Real/Larger

t: To determine the type and size of the image formed, we need to analyze the position of the object relative to the focal length.
a: **QueryLanguageModel("What type of image is formed when an object is placed at a distance of $1.5f$ from a converging lens of focal length f ?)**
o: When an object is placed at a distance of 1.5 times the focal length ($1.5f$) from a converging lens, the lens forms a real, inverted, and magnified image. Additionally, to find the magnification $\frac{1}{m}$, we use $\frac{1}{m} = \frac{v}{u} = \frac{f}{3f-2f} = 1$.
t: The image is real and inverted, and the magnification indicates that the image size is larger than the object.
a: **Terminate("A")**

Q: Who created this image?
A. PAUL CÉZANN, B. EDVARD MUNCH, C. EDGAR DEGAS, D. ANDY WARHOL

t: To determine the creator of the artwork in image-0, I need to analyze its style and characteristics.
a: **QueryLanguageModel("Who created the painting with a dark, expressive style often associated with emotional intensity?")**
o: The painting style you're describing sounds like it could be associated with several artists, but one of the most prominent figures known for a dark, expressive style and emotional intensity is Edvard Munch. His famous painting "The Scream" epitomizes such characteristics...
t: Based on the description of a dark, expressive style often associated with emotional intensity, Edvard Munch is the most likely creator.
a: **Terminate("B")**

Q: The picture shows the microscopy of Mr Tan's gastric tumour. Which of the following statements is CORRECT?
A. The findings show an adenoma
B. The findings show a squamous cell carcinoma
C. The findings show intestinal type adenocarcinoma
D. The findings show diffuse signet ring cell adenocarcinoma the Flemish city of Bruges.

t: To determine the correct statement, I need to analyze the microscopic features in the image.
a: **QueryLanguageModel("What are the microscopic features of adenoma, squamous cell carcinoma, intestinal type adenocarcinoma, and diffuse signet ring cell adenocarcinoma?")**
o: "The microscopic features of the mentioned conditions are distinct and reflective of their pathological origins: 1. **Adenoma**: - **Architectural Features**: Typically show glandular structures with some degree of dysplasia...3. **Intestinal Type Adenocarcinoma**: - **Architectural Features**: Gland-forming neoplasm with varying degrees of differentiation...}
t: The image shows a gastric tumour with specific architectural and cellular features. Based on the options, diffuse signet ring cell adenocarcinoma is known for its distinct signet ring cells, which may be present in the image.
a: **Terminate("D")**

Listing 1: Python implementation of all actions

```

1 [BEGIN OF GOAL]
2 You are a helpful assistant, and your goal is to solve the # USER REQUEST #. You can either rely
  on your own capabilities or perform actions with external tools to help you. A list of all
  available actions are provided to you in the below.
3 [END OF GOAL]
4
5 [BEGIN OF ACTIONS]
6 Name: OCR
7 Description: Extract texts from an image or return an empty string if no text is in the image.
  Note that the texts extracted may be incorrect or in the wrong order. It should be used as a
  reference only.
8 Arguments: {'image': 'the image to extract texts from.'}
9 Returns: {'text': 'the texts extracted from the image.'}
10 Examples:
11 {"name": "OCR", "arguments": {"image": "image-0"}}
12
13 Name: LocalizeObjects
14 Description: Localize one or multiple objects/regions with bounding boxes. This tool may output
  objects that don't exist or miss objects that do. You should use the output only as weak
  evidence for reference. When answering questions about the image, you should double-check the
  detected objects. You should be especially cautious about the total number of regions detected
  , which can be more or less than the actual number.
15 Arguments: {'image': 'the image to localize objects/regions in.', 'objects': "a list of object
  names to localize. e.g. ['dog', 'cat', 'person']. the model might not be able to detect rare
  objects or objects with complex descriptions."}
16 Returns: {'image': 'the image with objects localized and visualized on it.', 'regions': "the
  regions of interests localized in the image, where each region is represented by a dictionary
  with the region's label text, bounding box and confidence score. The confidence score is
  between 0 and 1, where 1 means the model is very confident. Note that both the bounding boxes
  and confidence scores can be unreliable and should only be used as reference."}
17 Examples:
18 {"name": "LocalizeObjects", "arguments": {"image": "image-0", "objects": ["dog", "cat"]}}
19
20 Name: GetObjects
21 Description: Using this function to get objects in an image.
22 Arguments: {'image': 'the image to get objects from.'}
23 Returns: {'objects': 'the objects detected in the image.'}
24 Examples:
25 {"name": "GetObjects", "arguments": {"image": "image-0"}}
26
27 Name: EstimateRegionDepth
28 Description: Estimate the depth of a region in an image using DepthAnything model. It returns an
  estimated depth value of the region specified by the input bounding box. The smaller the value
  is, the closer the region is to the camera, and the larger the farther. This tool may help
  you to better reason about the spatial relationship, like which object is closer to the camera
  .
29 Arguments: {'image': 'the image to get the depth from.', 'bbox': 'the bbox of the region to get
  the depth from. It should be a list of [left, top, right, bottom], where each value is a float
  between 0 and 1 to represent the percentage of the image width/height and how far it is from
  the top left corner at [0, 0].'}
30 Returns: {'depth': 'the estimated depth of the region.'}
31 Examples:
32 {"name": "EstimateRegionDepth", "arguments": {"image": "image-0", "bbox": [0.3, 0.2, 0.5, 0.4]}}
33
34 Name: EstimateObjectDepth
35 Description: Estimate the depth of an object in an image using DepthAnything model. It returns an
  estimated depth value of the object specified by the a brief text description. The smaller the
  value is, the closer the object is to the camera, and the larger the farther. This tool may
  help you to better reason about the spatial relationship, like which object is closer to the
  camera.
36 Arguments: {'image': 'the image to get the depth from.', 'object': 'a short description of the
  object to get the depth from.'}
37 Returns: {'depth': 'the estimated depth of the object.'}
38 Examples:
39 {"name": "EstimateObjectDepth", "arguments": {"image": "image-0", "object": "a black cat"}}
40
41 Name: Crop
42 Description: Crop an image with the bounding box. It labels the cropped region with a bounding box
  and crops the region with some margins around the bounding box to help with contextual
  understanding of the region.

```

```

43 Arguments: {'image': 'the image to crop.', 'bbox': 'the bbox to crop. It should be a list of [left,
    top, right, bottom], where each value is a float between 0 and 1 to represent the percentage
    of the image width/height and how far it is from the top left corner at [0, 0].'}
44 Returns: {'image': 'the cropped image.'}
45 Examples:
46 {"name": "Crop", "arguments": {"image": "image-0", "bbox": [0.33, 0.21, 0.58, 0.46]}}
47
48 Name: ZoomIn
49 Description: Zoom in on a region of the input image. This tool first crops the specified region
    from the image with the bounding box and then resizes the cropped region to create the zoom
    effect. It also adds some margins around the cropped region to help with contextual
    understanding of the region.
50 Arguments: {'image': 'the image to zoom in on.', 'bbox': 'The bbox should be a list of [left, top,
    right, bottom], where each value is a float between 0 and 1 to represent the percentage of
    the image width/height and how far it is from the top left corner at [0, 0].', 'zoom_factor':
    'the factor to zoom in by. It should be greater than 1.'}
51 Returns: {'image': 'the zoomed in image.'}
52 Examples:
53 {"name": "ZoomIn", "arguments": {"image": "image-0", "bbox": [0.4, 0.3, 0.5, 0.4], "zoom_factor":
    2}}
54
55 Name: QueryLanguageModel
56 Description: Using this function to ask a language model a question.
57 Arguments: {'query': 'the question to ask the language model.'}
58 Returns: {'result': 'the response from the language model.'}
59 Examples:
60 {"name": "QueryLanguageModel", "arguments": {"query": "What is the capital of France?"}}
61
62 Name: GetImageToImagesSimilarity
63 Description: Get the similarity between one image and a list of other images. Note that this
    similarity score may not be accurate and should be used as a reference only.
64 Arguments: {'image': 'the reference image.', 'other_images': 'the other images to compare to the
    reference image.'}
65 Returns: {'similarity': 'the CLIP similarity scores between the reference image and the other
    images.', 'best_image_index': 'the index of the most similar image.'}
66 Examples:
67 {"name": "GetImageToImagesSimilarity", "arguments": {"image": "image-0", "other_images": ["image
    -1", "image-2"]}}
68
69 Name: GetImageToTextsSimilarity
70 Description: Get the similarity between one image and a list of texts. Note that this similarity
    score may not be accurate and should be used as a reference only.
71 Arguments: {'image': 'the reference image.', 'texts': 'a list of texts to compare to the reference
    image.'}
72 Returns: {'similarity': 'the CLIP similarity between the image and the texts.', 'best_text_index':
    'the index of the most similar text.', 'best_text': 'the most similar text.'}
73 Examples:
74 {"name": "GetImageToTextsSimilarity", "arguments": {"image": "image-0", "texts": ["a cat", "a dog
    "]}}
75
76 Name: GetTextToImagesSimilarity
77 Description: Get the similarity between one text and a list of images. Note that this similarity
    score may not be accurate and should be used as a reference only.
78 Arguments: {'text': 'the reference text.', 'images': 'a list of images to compare to the reference
    text.'}
79 Returns: {'similarity': 'the CLIP similarity between the image and the texts.', 'best_image_index':
    'the index of the most similar image.'}
80 Examples:
81 {"name": "GetTextToImagesSimilarity", "arguments": {"text": "a black and white cat", "images": ["
    image-0", "image-1"]}}
82
83 Name: DetectFaces
84 Description: Using this function to detect faces in an image.
85 Arguments: {'image': 'the image to detect faces from.'}
86 Returns: {'image': 'the image with objects localized and visualized on it.', 'regions': "the
    regions of the faces detected, where each region is represented by a dictionary with the region
    's label text and bounding box."}
87 Examples:
88 {"name": "DetectFaces", "arguments": {"image": "image-0"}}
89

```

```

90 Name: QueryKnowledgeBase
91 Description: Using this function to query a knowledge base.
92 Arguments: {'query': 'the query to search in a knowledge base such as wikipedia.'}
93 Returns: {'result': 'the answer from the knowledge base.'}
94 Examples:
95 {"name": "QueryKnowledgeBase", "arguments": {"query": "Paris"}}
96
97 Name: Calculate
98 Description: Calculate a math expression.
99 Arguments: {'expression': 'the math expression to calculate.'}
100 Returns: {'result': 'the result of the math expression.'}
101 Examples:
102 {"name": "Calculate", "arguments": {"expression": "2 + 2"}}
103 {"name": "Calculate", "arguments": {"expression": "4*9*84"}}
104 {"name": "Calculate", "arguments": {"expression": "5-4/2"}}
105
106 Name: SolveMathEquation
107 Description: Using this action to solve a math problem with WolframAlpha.
108 Arguments: {'query': 'a question that involves a math equation to be solved.'}
109 Returns: {'result': 'the result of the query.'}
110 Examples:
111 {"name": "SolveMathEquation", "arguments": {"query": "2 + 2=?"}}
112 {"name": "SolveMathEquation", "arguments": {"query": "x^2 + 2x + 1 = 0, what is x?"}}
113
114 Name: Terminate
115 Description: Using this function to finish the task.
116 Arguments: {'answer': 'the final answer.'}
117 Returns: {'answer': 'the final answer.'}
118 Examples:
119 {"name": "Terminate", "arguments": {"answer": "yes"}}
120
121 [END OF ACTIONS]
122
123 [BEGIN OF TASK INSTRUCTIONS]
124 1. You must only select actions from # ACTIONS #.
125 2. You can only call one action at a time.
126 3. If no action is needed, please make actions an empty list (i.e. 'actions': []).
127 4. You must always call Terminate with your final answer at the end.
128 [END OF TASK INSTRUCTIONS]
129
130 [BEGIN OF FORMAT INSTRUCTIONS]
131 Your output should be in a strict JSON format as follows:
132 {"thought": "the thought process, or an empty string", "actions": [{"name": "action1", "arguments":
133   {"argument1": "value1", "argument2": "value2"}}]}
134 [END OF FORMAT INSTRUCTIONS]
135
136 [BEGIN OF EXAMPLES]:
137 # USER REQUEST #:
138 In image-0, Which of the two objects on the plate is the biggest?
139 A. The pile of scrambled eggs is the biggest.
140 B. The strawberries are the biggest object.
141 Please answer directly with only the letter of the correct option and nothing else.
142 # RESPONSE #:
143 {"thought": "To determine which of the two objects on the plate is larger, I need to analyze the
144   size of the scrambled eggs, and the strawberries", "actions": [{"name": "LocalizeObjects", "
145   arguments": {"image": "image-0", "objects": ["scrambled eggs", "strawberries"]}]}
146 OBSERVATION:
147 {"image": "image-1", "regions": [{"label": "eggs", "bbox": [0.5, 0.6, 0.6, 0.8], "score": 0.85},
148   {"label": "strawberries", "bbox": [0.4, 0.5, 0.45, 0.7], "score": 0.54}]}
149 {"thought": "To calculate the area of a bounding box, we can use the formula: area = (x_max -
150   x_min) * (y_max - y_min). We first get the area of the scrambled eggs.", "actions": [{"name":
151   "Calculate", "arguments": {"expression": "(0.6-0.5) * (0.8-0.6)"}]}
152 OBSERVATION:
153 {"result": "0.02"}
154 {"thought": "Then, we also calculate the area of the strawberries.", "actions": [{"name": "
155   Calculate", "arguments": {"expression": "(0.45-0.4) * (0.7-0.5)"}]}
156 OBSERVATION:
157 {"result": "0.01"}
158 {"thought": "Since 0.02 > 0.01, it is apparent that the eggs cover a larger area within their
159   bounding box.", "actions": [{"name": "Terminate", "arguments": {"answer": "A"}]}

```

```

152
153 # USER REQUEST #:
154 Given the input image image-0, How many pedestrians are there in the image? Please answer
    directly with a single word or number.
155 # RESPONSE #:
156 {"thought": "To determine the number of pedestrians, I need to first localize them on the image.",
    "actions": [{"name": "LocalizeObjects", "arguments": {"image": "image-0", "objects": ["person
    "]}}]}
157 OBSERVATION:
158 {"image": "image-1", "regions": [{"label": "person", "bbox": [0.77, 0.47, 0.79, 0.54], "score":
    0.83}, {"label": "person-2", "bbox": [0.69, 0.49, 0.7, 0.52], "score": 0.43}]}
159 {"thought": "The LocalizeObjects action returns two regions for \"person\", but one of the regions
    has a lower confidence score. Upon a closer look at the output image image-1, we can see that
    there is actually only one pedestrian in the image.", "actions": [{"name": "Terminate", "
    arguments": {"answer": "1"}}]}
160
161 # USER REQUEST #:
162 Based on image-0, is the object on top bigger than the object below?
163 A. The object on the bottom is bigger.
164 B. The object on top is bigger.
165 C. Both objects are the same size.
166 Please answer directly with only the letter of the correct option and nothing else.
167 # RESPONSE #:
168 {"thought": "By looking at the image, we can see that both objects are game consoles of the same
    brand and size.", "actions": [{"name": "Terminate", "arguments": {"answer": "C"}}]}
169
170 # USER REQUEST #:
171 What is x in the image?
172 # RESPONSE #:
173 {"thought": "To get the result of the equation, I need to first extract the equation from the
    image.", "actions": [{"name": "OCR", "arguments": {"image": "image-0"}}]}
174 OBSERVATION:
175 {"text": "x-2^3=0"}
176 {"thought": "The math equation is 'x-2^3=0', and I need to find x. I can solve it with a math-
    related tool.", "actions": [{"name": "SolveMathEquation", "arguments": {"query": "x-2^3=0,
    what is x?"}}]}
177 OBSERVATION:
178 {"result": "x = 8"}
179 {"thought": "As suggested in the last observation, the answer is 8.", "actions": [{"name": "
    Terminate", "arguments": {"answer": "8"}}]}

1 Compare the ground truth and prediction from AI models, to give a correctness score for the
  prediction. <AND> in the ground truth means it is totally right only when all elements in the
  ground truth are present in the prediction, and <OR> means it is totally right when any one
  element in the ground truth is present in the prediction. The correctness score is 0.0 (
  totally wrong), 0.1, 0.2, 0.3, 0.4, 0.5, 0.6, 0.7, 0.8, 0.9, or 1.0 (totally right). Just
  complete the last space of the correctness score.
2 Question | Ground truth | Prediction | Correctness
3 --- | --- | --- | ---
4 What is x in the equation? | -1 <AND> -5 | x = 3 | 0.0
5 What is x in the equation? | -1 <AND> -5 | x = -1 | 0.5
6 What is x in the equation? | -1 <AND> -5 | x = -5 | 0.5
7 What is x in the equation? | -1 <AND> -5 | x = -5 or 5 | 0.5
8 What is x in the equation? | -1 <AND> -5 | x = -1 or x = -5 | 1.0
9 Can you explain this meme? | This meme is poking fun at the fact that the names of the countries
  Iceland and Greenland are misleading. Despite its name, Iceland is known for its beautiful
  green landscapes, while Greenland is mostly covered in ice and snow. The meme is saying that
  the person has trust issues because the names of these countries do not accurately represent
  their landscapes. | The meme talks about Iceland and Greenland. It's pointing out that despite
  their names, Iceland is not very icy and Greenland isn't very green. | 0.4
10 Can you explain this meme? | This meme is poking fun at the fact that the names of the countries
  Iceland and Greenland are misleading. Despite its name, Iceland is known for its beautiful
  green landscapes, while Greenland is mostly covered in ice and snow. The meme is saying that
  the person has trust issues because the names of these countries do not accurately represent
  their landscapes. | The meme is using humor to point out the misleading nature of Iceland's
  and Greenland's names.
11 Iceland, despite its name, has lush green landscapes while Greenland is mostly covered in ice and
  snow. The text 'This is why I have trust issues' is a playful way to suggest that these
  contradictions can lead to distrust or confusion. The humor in this meme is derived from the
  unexpected contrast between the names of the countries and their actual physical
  characteristics. | 1.0

```

1 Please read the following example. Then extract the answer from the model response and type it at
  the end of the prompt.
2
3 Hint: Please answer the question requiring an integer answer and provide the final value, e.g., 1,
  2, 3, at the end.
4 Question: Which number is missing?
5 Model response: The number missing in the sequence is 14.
6 Extracted answer: 14
7
8 Hint: Please answer the question requiring a floating-point number with one decimal place and
  provide the final value, e.g., 1.2, 1.3, 1.4, at the end.
9 Question: What is the fraction of females facing the camera?
10 Model response: The fraction of females facing the camera is 0.6,
11 which means that six out of ten females in the group are facing the camera.
12 Extracted answer: 0.6
13
14 Hint: Please answer the question requiring a floating-point number with two decimal places and
  provide the final value, e.g., 1.23, 1.34, 1.45, at the end.
15 Question: How much money does Luca need to buy a sour apple candy and a butter-scotch candy? (Unit:
  $)
16 Model response: Luca needs $1.45 to buy a sour apple candy and a butterscotch candy.
17 Extracted answer: 1.45
18
19 Hint: Please answer the question requiring a Python list as an answer and provide the final list,
  e.g., [1, 2, 3], [1.2, 1.3, 1.4], at the end.
20 Question: Between which two years does the line graph saw its maximum peak?
21 Model response: The line graph saw its maximum peak between 2007 and 2008.
22 Extracted answer: [2007, 2008]
23
24 Hint: Please answer the question and provide the correct option letter, e.g., A, B, C, D, at the
  end.
25 Question: What fraction of the shape is blue?
26 Choices: (A) 3/11 (B) 8/11 (C) 6/11 (D) 3/5
27 Model response: The correct answer is (B) 8/11.
28 Extracted answer: B
