

# Encouraging Paragraph Embeddings to Remember Sentence Identity Improves Classification

Tu Vu, Mohit Iyer

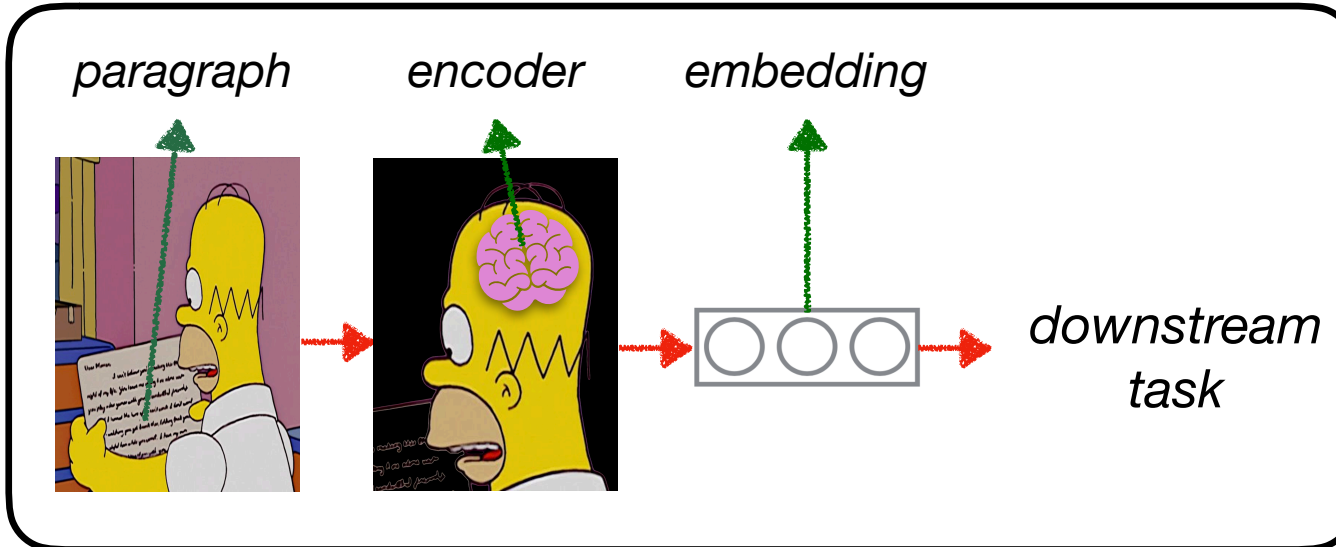

code at [github.com/tuvuumass/scope](https://github.com/tuvuumass/scope)

## What are paragraph embeddings?

Encode a given paragraph into a **single fixed-length vector representation**

### Applications

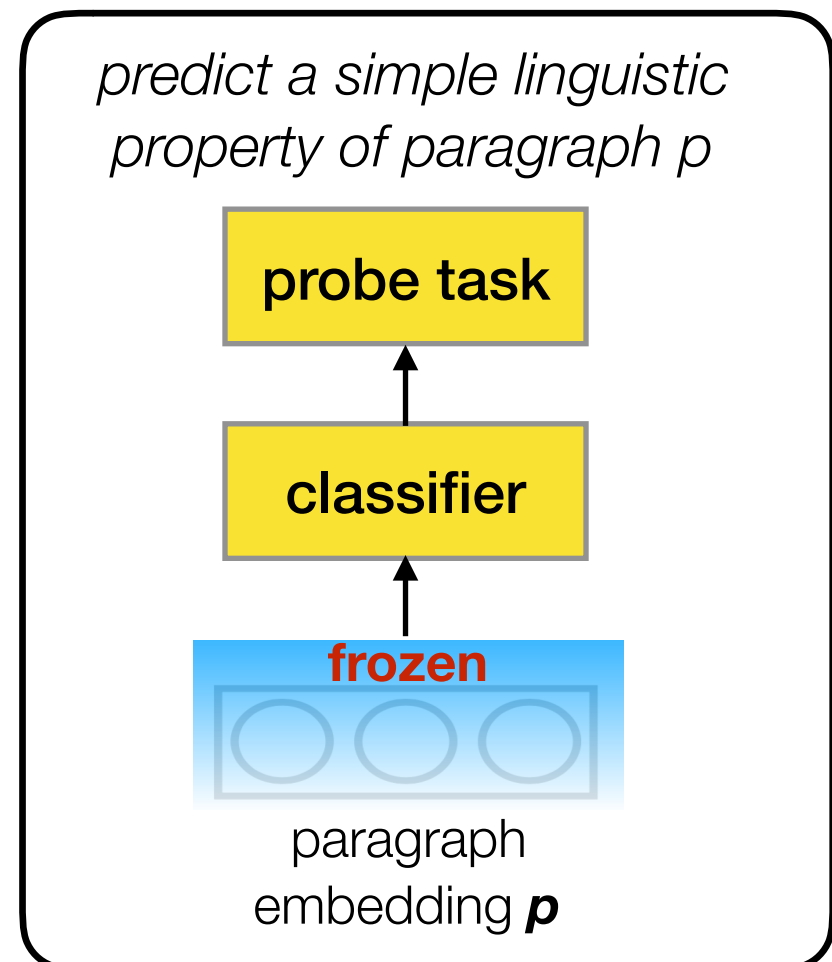

- ★ text classification
- ★ document retrieval
- ★ semantic similarity and relatedness

## How can we examine what linguistic properties they encode?

### Linguistic Probe Tasks

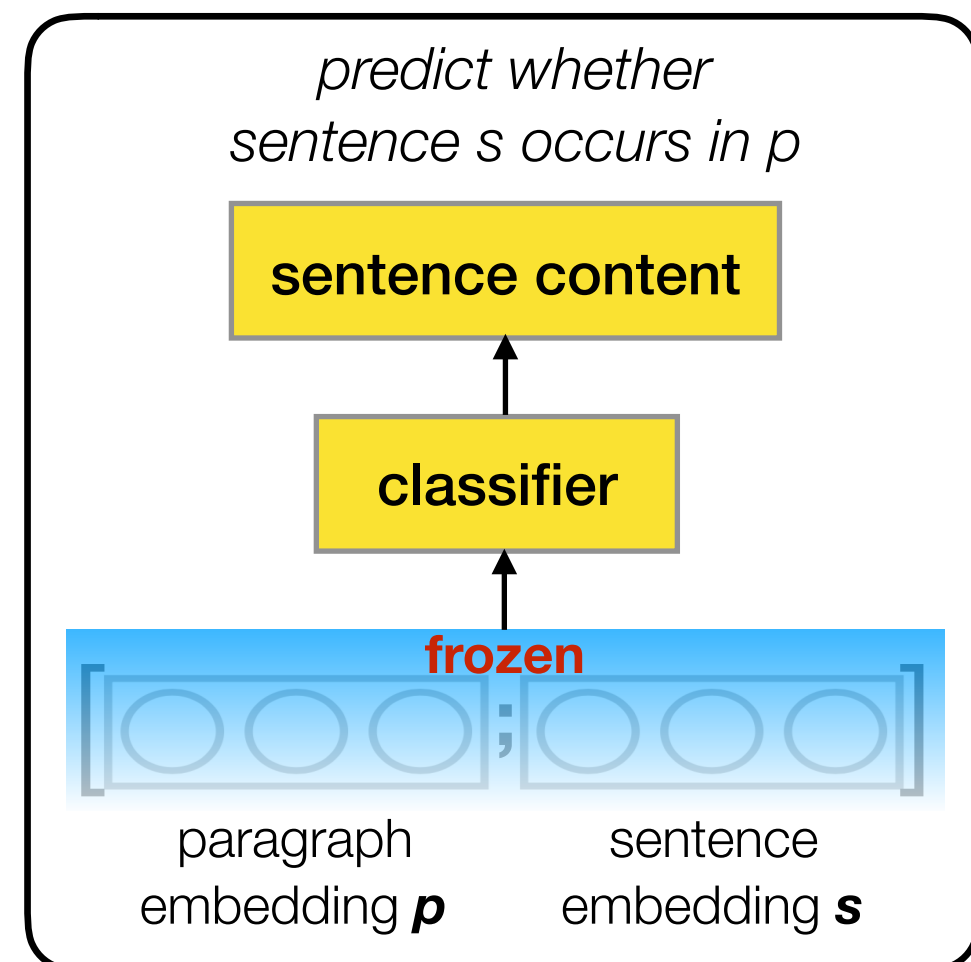

extended to the paragraph level

- ★ classification tasks
- ★ agnostic to the embedding method

### Sentence Content

binary classification

- ★ positive instances:  $[p; s^+]$ ,  $s^+$  from  $p$
- ★ negative instances:  $[p; s^-]$ ,  $s^-$  from another paragraph  $p'$

**Motivation:** word identity information is correlated with downstream sentence-level classification performance (Conneau et al., 2018)

## How well do they encode the identity of the sentences within a paragraph?

### Probe data

**Hotel Reviews** (Li et al., 2015; Zhang et al., 2017): 340K/20K/20K paragraphs for train/val/test

### Paragraph Embedding Models

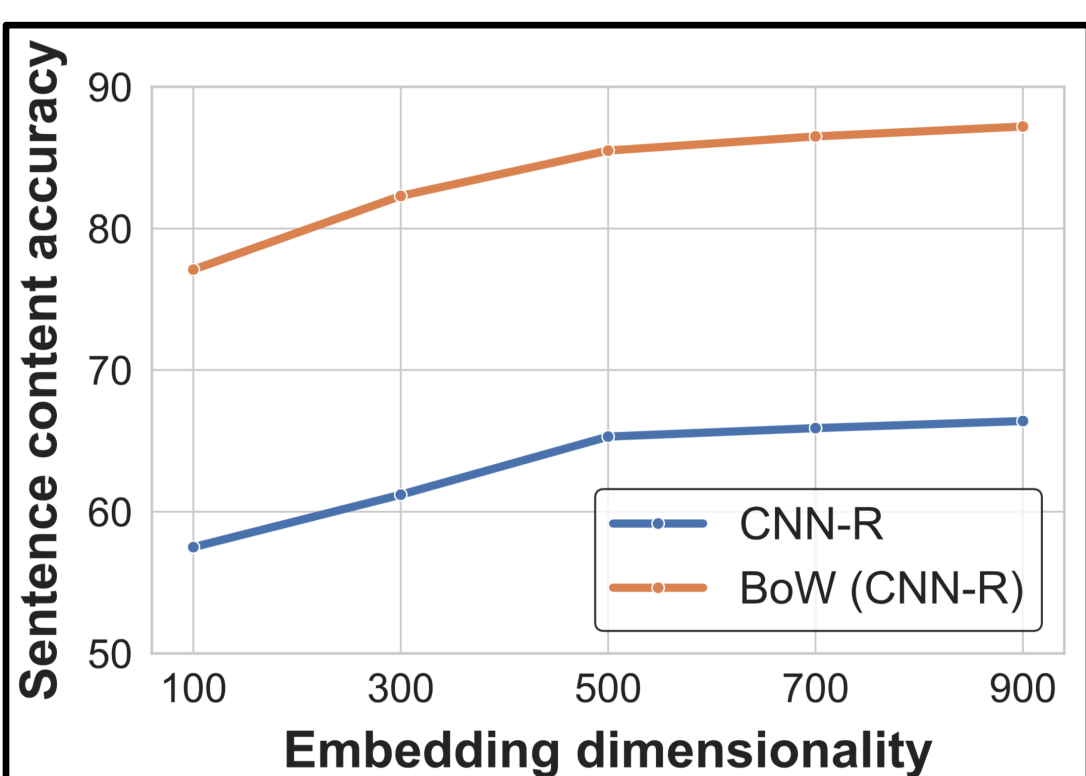

★ **CNN-R**, originally **CNN-DCNN** (Zhang et al., 2017):

- convolutional-deconvolutional encoder-decoder model + reconstruction objective
- powerful paragraph embeddings

★ **BOW (CNN-R)**

- average of CNN-R's word vectors

**BoW (CNN-R) outperforms CNN-R on sentence content across dimensions**

**BoW models outperform more complex models on sentence content**

| Model   | Dimensionality | Accuracy    |
|---|----------------|-------------|
| Random  | —              | 50.0        |
| <i>trained on paragraphs from Hotel Reviews</i> |                |             |
| BoW (CNN-R)                                     | 900            | <b>87.2</b> |
| Doc2VecC  | 900            | <b>90.8</b> |
| CNN-R   | 900            | 66.4        |
| LSTM-R  | 900            | 65.4        |
| <i>pre-trained on other datasets</i>            |                |             |
| BOW (Glove)                                     | 300            | <b>84.6</b> |
| BOW (ELMo)                                      | 1024           | <b>88.1</b> |
| Skip-Thoughts                                   | 4800           | 78.9        |
| InferSent                                       | 4096           | 68.7        |

**BoW (CNN-R) relies more heavily on low-level matching than CNN-R**

| Setting                         | CNN-R | BOW (CNN-R) |
|---------------------------------|-------|-------------|
| Without $s^+$ excluded from $p$ | 61.2  | <b>82.3</b> |
| With $s^+$ excluded from $p$    | 57.5  | <b>61.7</b> |

## Sentence content substantially boosts accuracy and generalization, outperforming reconstruction

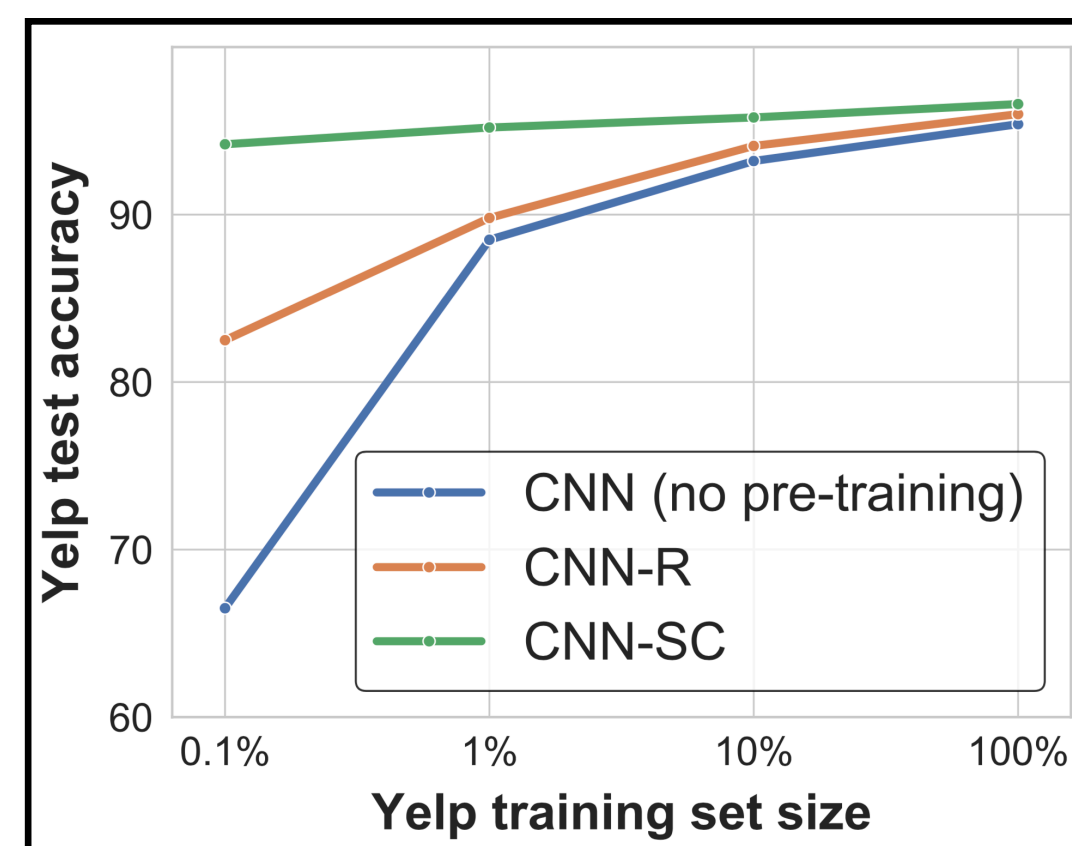

**Without fine-tuning, CNN-SC outperforms CNN-R by a large margin on both in-domain and out-of-domain data**

| Pre-training       | CNN-R | CNN-SC      |
|--------------------|-------|-------------|
| On Yelp            | 67.4  | <b>90.0</b> |
| On Wikipedia       | 61.4  | <b>65.7</b> |
| Wall-clock speedup | 1X    | <b>4X</b>   |

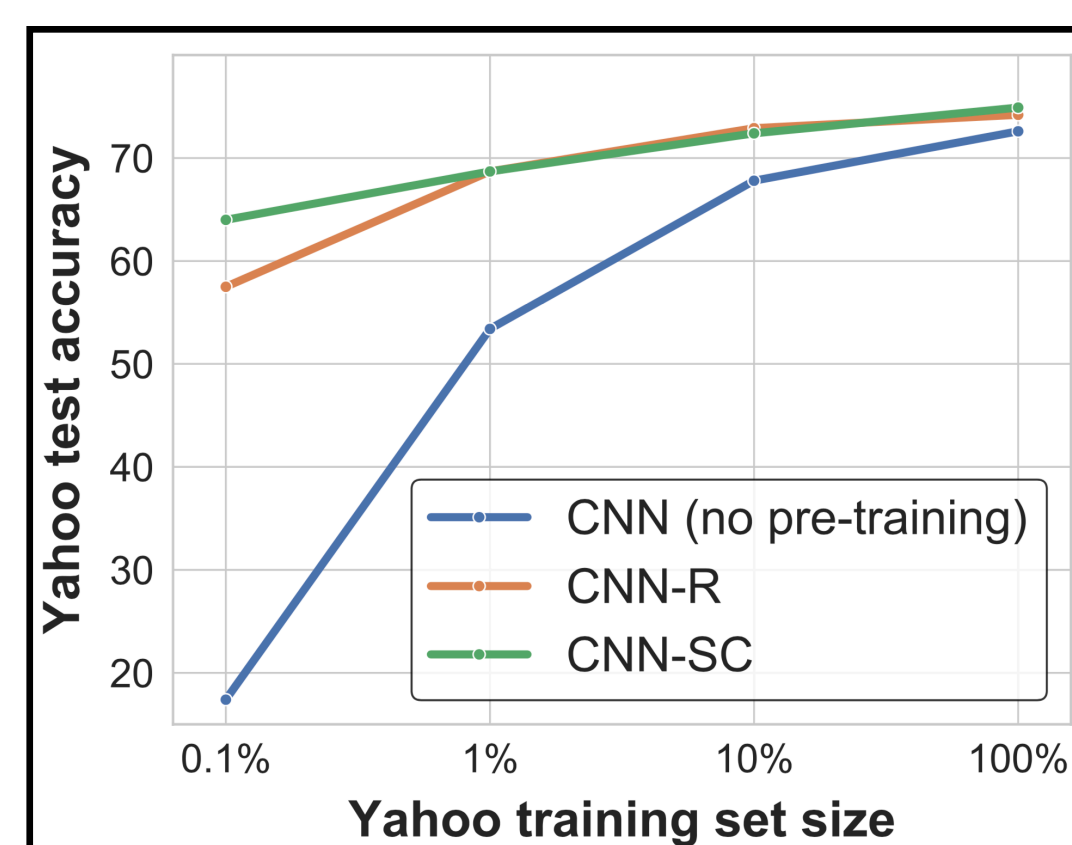

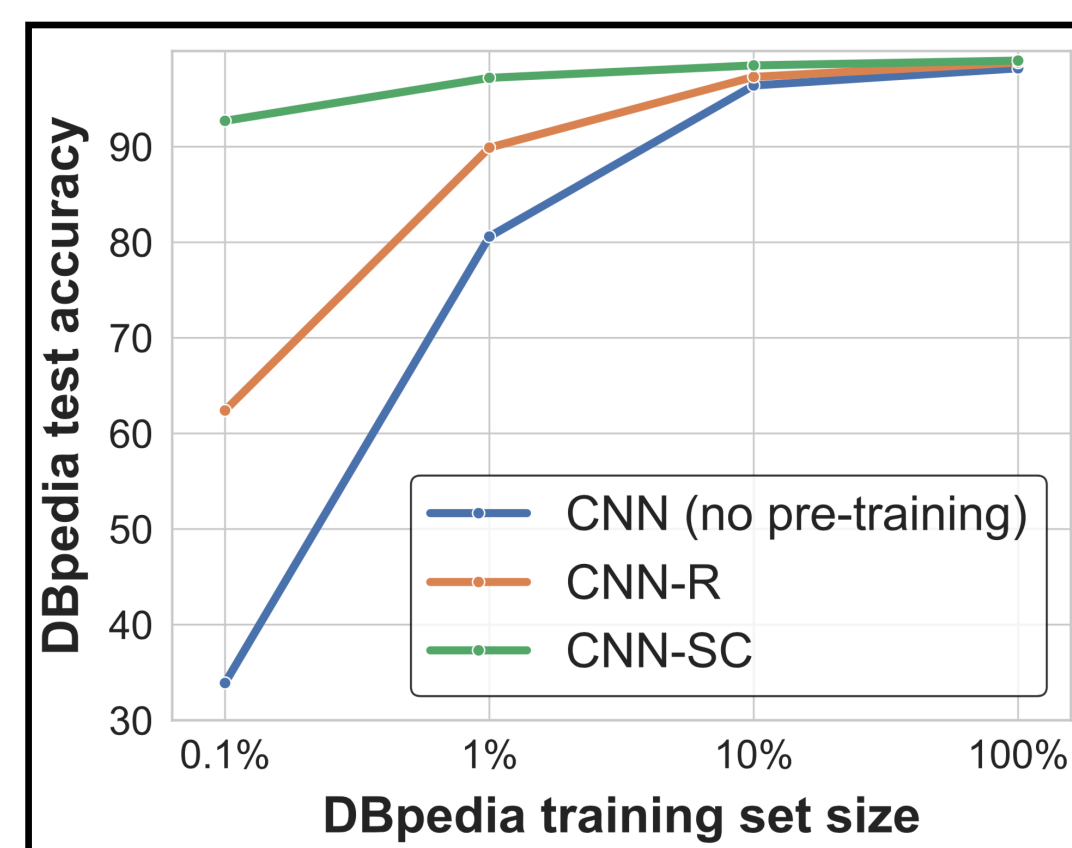

Yelp test accuracy

- ★ four times faster to train
- ★ better correlation to downstream accuracy

**Fine-tuning CNN-SC substantially boosts accuracy and generalization**

On Yelp, with only 500 labeled examples, it outperforms training from scratch on 200x more data

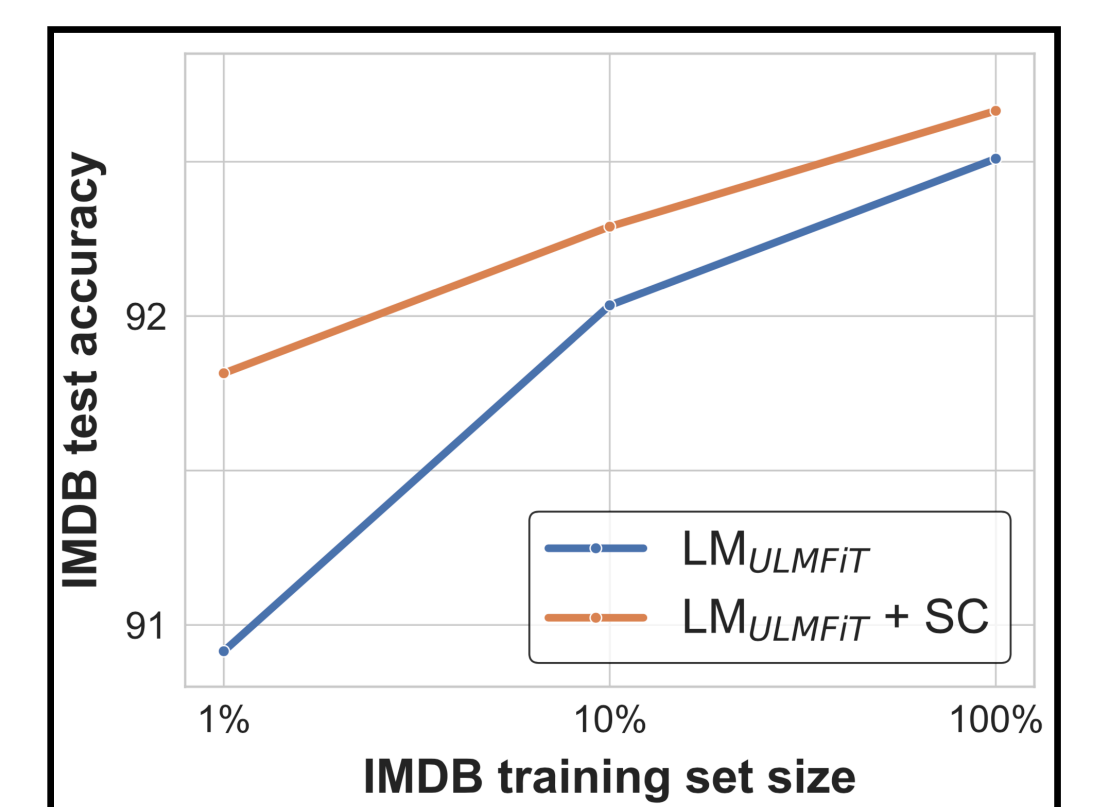

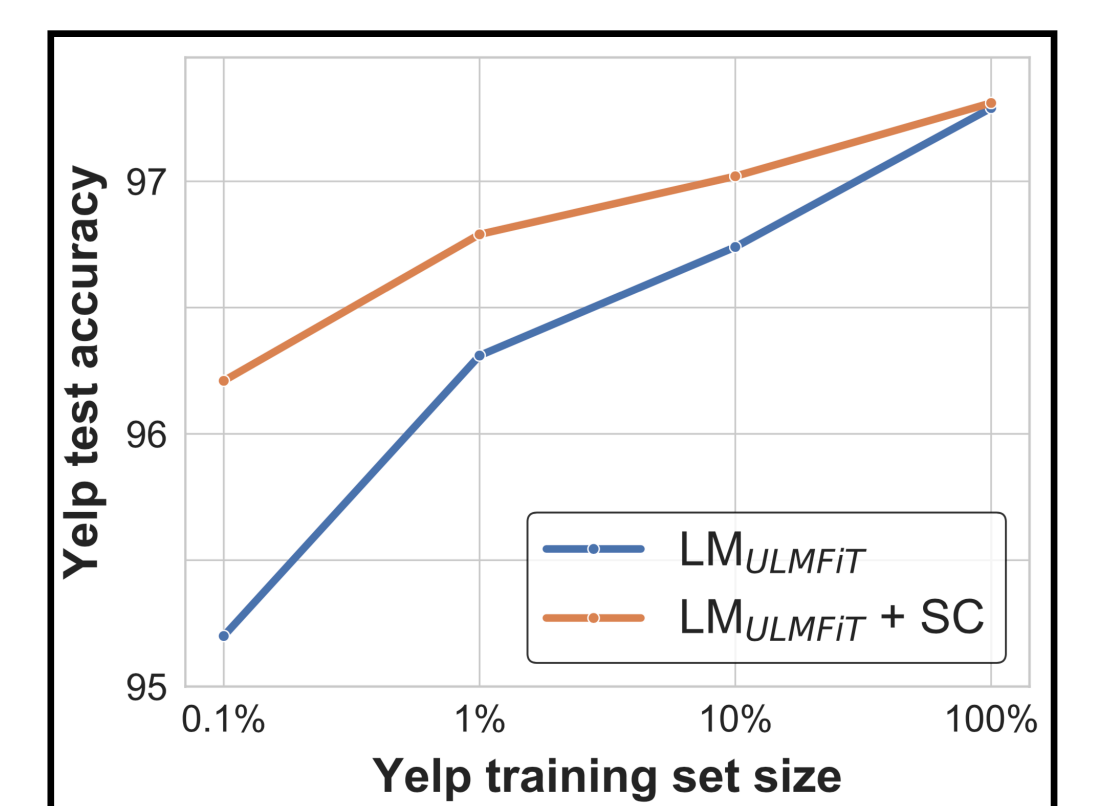

**CNN-SC outperforms baseline models that do not use external data, including CNN-R**

| Model   | Yelp        | DBpedia     | Yahoo       |
|---|-------------|-------------|-------------|
| <i>purely supervised w/o external data</i>          |             |             |             |
| ngrams TFIDF  | 95.4        | 98.7        | 68.5        |
| Large Word ConvNet                                  | 95.1        | 98.3        | 70.9        |
| Small Word ConvNet                                  | 94.5        | 98.2        | 70.0        |
| Large Char ConvNet                                  | 94.1        | 98.3        | 70.5        |
| Small Char ConvNet                                  | 93.5        | 98.0        | 70.2        |
| SA-LSTM (word level)                                | NA          | 98.6        | NA          |
| Deep ConvNet  | 95.7        | 98.7        | 73.4        |
| CNN (Zhang et al., 2017)                            | 95.4        | 98.2        | 72.6        |
| <i>pre-training + fine-tuning w/o external data</i> |             |             |             |
| CNN-R (Zhang et al., 2017)                          | 96.0        | 98.8        | 74.2        |
| CNN-SC (ours)                                       | <b>96.6</b> | <b>99.0</b> | <b>74.9</b> |
| <i>pre-training + fine-tuning w/ external data</i>  |             |             |             |
| ULMFIT (Howard and Ruder, 2018)                     | 97.8        | 99.2        | NA          |

**CNN-SC implicitly learns to distinguish between class labels**

**Sentence content learns complementary information to language modeling (LM)**

## Conclusions

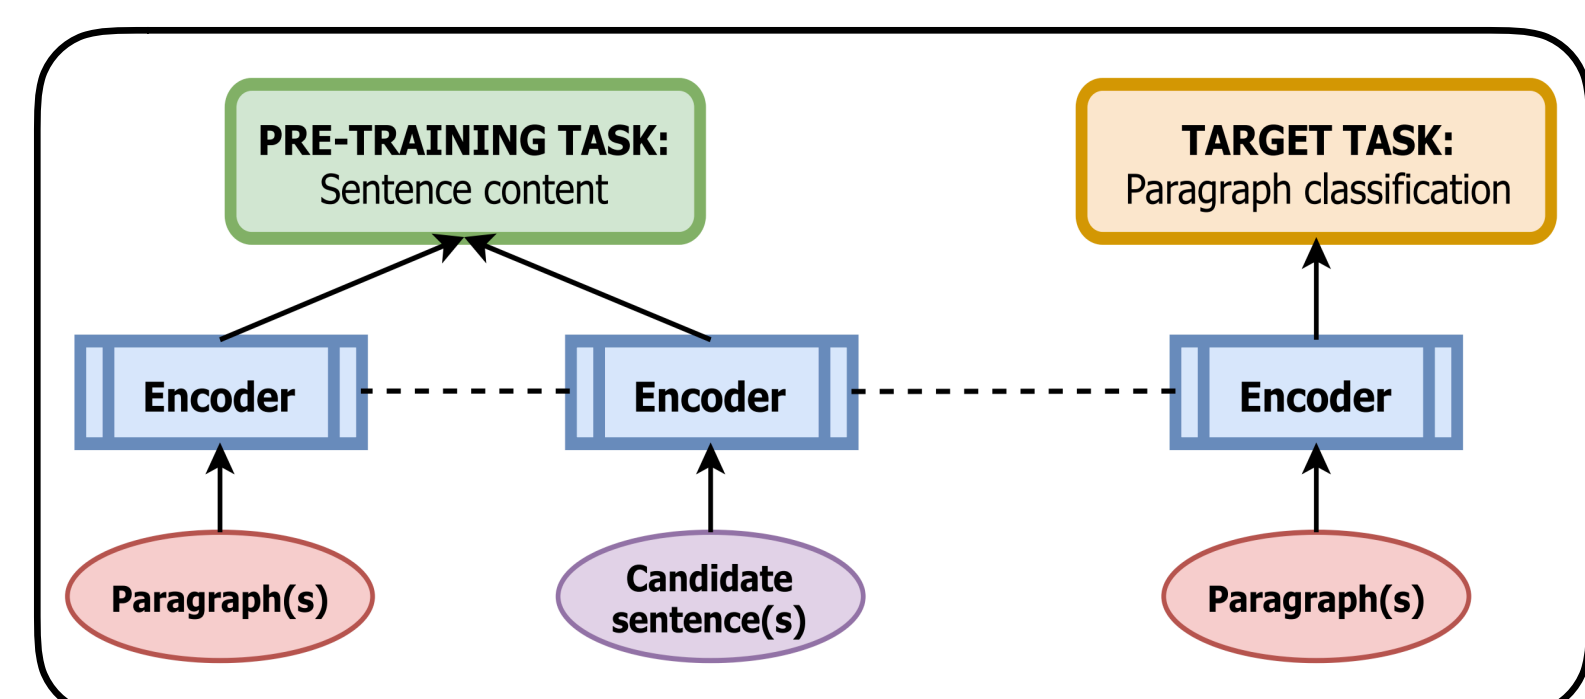

- ★ BoW models outperform more complex models on our sentence content probe
- ★ Incorporating probe objectives into downstream models might help improve performance
- ★ Future work: more linguistically-informed research into embedding methods
