ABSTRACT

Websites of businesses should accommodate both customer needs and business requirements. Traditional menu-driven navigation and key word search do not allow users to describe their intentions precisely. We have developed a *conversational interface to online shopping* that provides convenient, personalized access to information using natural language dialog. User studies show significantly reduced length of interactions in terms of time and number of clicks in finding products. The core dialog engine is easily adaptable to other domains.

1. INTRODUCTION

Natural language dialog has been used in many areas, such as for call-center/routing application (Carpenter & Chu-Carroll 1998), email routing (Walker, Fromer & Narayanan 1998), information retrieval and database access (Androutsopoulos & Ritchie 1995), and for telephony banking (Zadrozny et al. 1998). In this demonstration, we present a natural language dialog interface to online shopping. Our user studies show natural language dialog to be a very effective means for negotiating user's requests and intentions in this domain.

2. SYSTEM ARCHITECTURE

In our system, a *presentation manager* captures queries from users, employs a parser to transform the user's query into a logical form, and sends the logical form to a *dialog manager*. The presentation manager is also responsible for obtaining the system's response from the dialog manager and presenting it to the user using template-based generation. The dialog manager formulates action plans for an *action manager* to perform back-end tasks such as database access, business transactions, etc. The dialog manager applies information state-based dialog strategies to formulate responses depending on the current state, discourse history and the action results from the action manager.

The **Data Management Subsystem** maintains a "concept" repository with common sense "concepts" and a phrasal lexicon that lists possible ways for referring to the concepts. Business Rules map concepts to business specifications by defining concepts using a propositional logic formula of constraints over product specifications. Thus, the Business Rules reflect business goals and decisions. The Extended Database combines product specifications and precompiled evaluations of the concept definitions for each product to provide a representation that guides the natural language dialog. We are investigating automated tools for helping developers and maintainers extract relevant concepts and terms on the basis of user descriptions and queries about products.

3. EVALUATION

We conducted several user studies to evaluate the usability of NLA (Chai et al. 2000). In one study, seventeen test subjects preferred the dialog-driven navigation of NLA two to one over menu-driven navigation. Moreover, with NLA, the average number of clicks was reduced by 63.2% and the average time was reduced by 33.3%. Analysis of the user queries (average length = 5.31 words long; standard deviation = 2.62; 85% of inputs are noun phrases) revealed the brevity and relative linguistic simplicity of user input. Hence, shallow parsing techniques were adequate for processing user input. In general, sophisticated dialog management appears to be more important than the ability to handle complex natural language sentences. The user studies also highlighted the need to combine multiple modalities and styles of interaction.

Use your own words to find a ThinkPad with our new natural language search tool!

Please note that this is the first release of IBM's Natural Language search tool. This tool may not fully understand all of the terms you use. If you do not get an appropriate result, please help us improve by sending us your [feedback](#).

Step 1 - Type in what you're looking for

Tell us in your own words what you are looking for by typing in the box below.

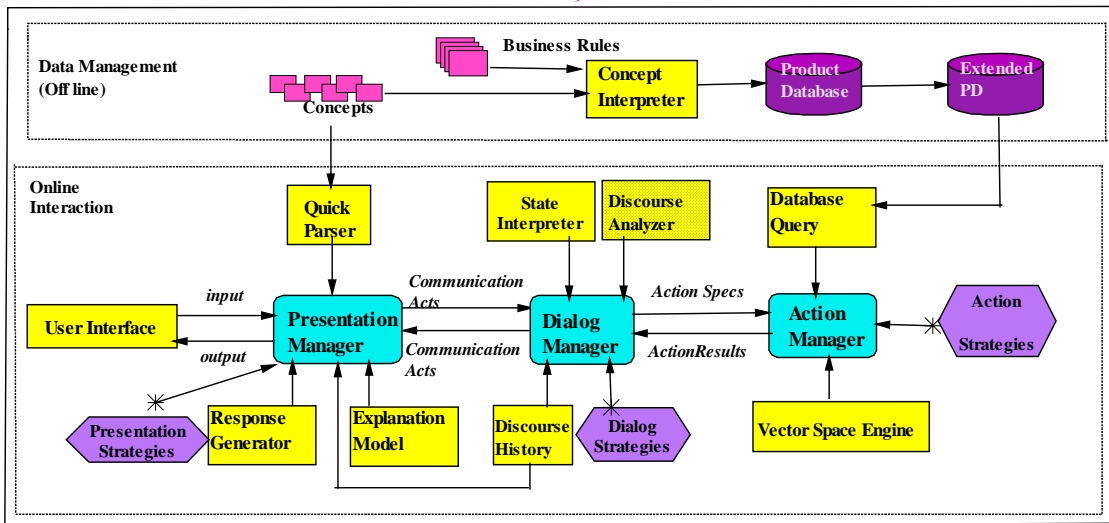

I am looking for: ([Sample questions](#))

affordable laptop with a large screen that I could use for software development

Step 2 - Tell us how much experience you have with notebook computers

How familiar are you with notebook computers?

Very Somewhat Not
