# A CHUNKING-AND-RAISING PARTIAL PARSER

## Hsin-Hsi Chen Yue-Shi Lee Department of Computer Science and Information Engineering National Taiwan University Taipei, Taiwan, R.O.C. E-mail: hh\_chen@csie.ntu.edu.tw; leeys@nlg.csie.ntu.edu.tw

#### Abstract

Parsing is often seen as a combinatorial problem. It is not due to the properties of the natural languages, but due to the parsing strategies. This paper investigates a Constrained Grammar extracted from a Treebank and applies it in a non-combinatorial partial parser. This parser is a simpler version of a chunking-and-raising parser. The chunking and raising actions can be done in linear time. The short-term goal of this research is to help the development of a partially bracketed corpus, i.e., a simpler version of a treebank. The long-term goal is to provide high level linguistic constraints for many natural language applications.

#### 1 Introduction

Recently, many parsers [1-10] have been proposed. Of these, some [1-7] belong to full parsers and some [8-10] partial parsers. Because the polycategory of a word and the use of the formal grammar, parsing is often seen as a combinatorial problem [11]. A feasible way to treat this problem is to separate the work of category determination from a parser and adopt a new parsing scheme. That is, automatic part-of-speech tagging serves as preprocessing of the parser. The tagging problem has been investigated by many researchers [12-18], and many interesting results have been demonstrated. Thus the remaining problem is how to construct a new non-combinatorial parser to increase the parsing efficiency and decrease the parsing ambiguity. This paper will propose a chunking-and-raising partial parser for such a goal. Section 2 introduces the framework of this parser. Section 3 specifies the training corpus - Lancaster Parsed Corpus, and Section 4 touches on how to extract Constrained Grammar from this corpus. Section 5 presents a simplified parsing algorithm based on Constrained Grammar. Before concluding the experimental results and the related works are shown.

### 2 Framework of a Chunking-and-Raising Parser

Fig. 1. The Chunking-and-Raising Scheme

In this scheme, parsing can be regarded as a sequence of actions of chunking and raising. Fig. 1 shows the configuration. An input sentence W is input to a part-of-speech tagger and a (lexical) tag sequence P is produced. The output of the tagger is the input of the parser. The chunking model of the parser groups some tags into chunks. The raising model assigns a (syntactic) tag to each chunk and generates a new tag sequence P'. The chunking and raising actions are repeated until no new chunking sequence is generated.

Consider an example. Let the input sentence be "Mr. Macleod went on with the conference at Lancaster House despite the crisis which had blown up .". The corresponding part-of-speech sequence is shown as follows.

NPT NP VBD RP IN ATI NN IN NP NPL IN ATI NN WDT HVD VBN RP. The chunking model produces a chunking sequence shown below.

[NPT NP] [VBD] [RP] IN ATI NN IN [NP NPL] IN ATI NN [WDT] [HVD VBN][RP].

Seven parts-of-speech which cannot be formed into chunks at this step remain in the sequence. The raising model then generates the following chunking-and-raising sequence.

[ N NPT NP N ] [ V VBD V ] [ R RP R ] IN ATI NN IN [ N NP NPL N ] IN ATI NN [ Nq WDT Nq ] [ V HVD VBN V ] [ R RP R ].

[ N NPT NP N ] denotes that the chunk [ NPT NP ] is raised to N. Similarly, the chunks [ VBD ], [ RP ]. [ NP NPL ], [ WDT ], [ HVD VBN ] and [ RP ] are raised to V, R, N, Nq, V and R, respectively. The seven syntactic tags and the remaining lexical tags form a new tag sequence and it is sent to the next chunking-and-raising cycle. If the word information is put back into the sequence, a partial parsed sentence is generated as follows.

[ N Mr.\_NPT Macleod\_NP N ] [ V went\_VBD V ] [ R on\_RP R ] with\_IN the\_ATI conference\_NN at\_IN [ N Lancaster\_NP House\_NPL N ] despite\_IN the\_ATI crisis\_NN [ Nq which\_WDT Nq ] [ V had\_HVD blown\_VBN V ] [ R up\_RP R ] .\_.

After one more chunking-and-raising cycle, the partial parsed sentence is generated as follows.

[ N Mr.\_NPT Macleod\_NP N ] [ V went\_VBD V ] [ R on\_RP R ] with\_IN the\_ATI conference\_NN [ P at\_IN [ N Lancaster\_NP House\_NPL N ] P ] despite\_IN the\_ATI crisis\_NN [ Fr [ Nq which\_WDT Nq ] [ V had\_HVD blown\_VBN V ] [ R up\_RP R ] Fr ] .\_.

In other words, a new tag sequence "N V R IN ATI NN P IN ATI NN Fr." is generated. We repeat these two actions until no more chunking sequence is generated.

A Constrained Grammar is extracted from a Treebank and is applied in a simpler version of chunking-and-raising parser. The chunking and raising actions are applied only once in this parser. Thus it only produces a linear chunking-and-raising sequence, not a hierarchical annotated tree. The experimental framework is shown in Fig. 2.

#### Fig. 2. The Experimental Framework

In this experiment, the Lancaster Parsed Corpus is adopted to train the chunking and raising models. Besides, it is also used in the performance evaluation.

## **3** Lancaster Parsed Corpus

The Lancaster Parsed Corpus is a modified and a condensed version of Lancaster-Oslo/Bergen (LOB) Corpus. It only contains one sixth of LOB Corpus, but involves more information than LOB Corpus. The corpus consists of fifteen kinds of texts (about 150,000 words). Each category corresponds to one file. The tagging set of Lancaster Parsed Corpus is extended and modified from LOB Corpus. The following shows a snapshot of Lancaster Parsed Corpus.

A01 1 [S[P by\_IN [N Trevor\_NP Williams\_NP N]P] .\_. S] A01 2 [S[N a\_AT move\_NN [Ti[Vi to\_TO stop\_VB Vi][N \0Mr\_NPT Gaitskell\_NP N][P from\_IN [Tg[Vg nominating\_VBG Vg][N any\_DTI more\_AP labour\_NN life\_NN peers\_NNS N]Tg]P]Ti]N][V is\_BEZ V][Ti[Vi to\_TO be\_BE made\_VBN Vi][P at\_IN [N a\_AT meeting\_NN [Po of\_INO [N labour\_NN \0MPs\_NPTS N]Po]N]P][N tomorrow\_NR N]Ti] .\_. S] A01 3 [S&[N \0Mr\_NPT Michael\_NP Foot\_NP N][V has\_HVZ put\_VBN V][R down\_RP R][N a\_AT resolution\_NN [P on\_IN [N the\_ATI subject\_NN N]P]N][S+ and\_CC [Na he\_PP3A Na][V is\_BEZ V][Ti[Vi to\_TO be\_BE backed\_VBN Vi][P by\_IN [N \0Mr\_NPT Will\_NP Griffiths\_NP ,\_, [N \0MP\_NPT [P for\_IN [N Manchester\_NP Exchange\_NP N]P]N]N]P]Ti]S+] .\_. S&]

A01 4

[S[Fa though\_CS [Na they\_PP3AS Na][V may\_MD gather\_VB V][N some\_DTI leftwing\_JJB support\_NN N]Fa] ,\_, [N a\_AT large\_JJ majority\_NN [Po of\_INO [N labour\_NN \0MPs\_NPTS N]Po]N][V are\_BER V][J likely\_JJ J][Ti[Vi to\_TO turn\_VB Vi][R down\_RP R][N the\_ATI Foot-Griffiths\_NP resolution\_NN N]Ti] .\_. S]

A01 5

\*' \*' [S[V abolish VB V][N Lords NPTS N] \*\*'\_\*\*' ... S]

These are extracted from the first five sentences of category A. Before each sentence, a unique reference number, e.g., "A01 1", denotes its source. Each word is appended with a lexical tag, e.g., "by\_IN", "Trevor\_NP". The syntactic tag is shown by opening and closing brackets.

To indicate that phrases or clauses are coordinated, the symbols "&", "-" or "+" will be used at the end of a phrase or a clause tag. An example is listed as follows.

[ N& mothers\_NNS ,\_, [ N- children\_NNS N- ] [ N+ and\_CC sick\_JJ people\_NNS N+ ] N& ]

The first coordinated phrase is not labeled any tag. The second and the third coordinated phrases are labeled N- and N+, respectively. This is because N- or N+ tends to include ellipsis. Table 1 gives an overview of the Lancaster Parsed Corpus. In our experiment, those parsed sentences that don't begin with "[S" and end with "S]" are removed from the training corpus. Thus "A01 5" is deleted.

Category	# of Sentences	# of Words	Category	# of Sentences	# of Words
Α	3403	9410	J	2713	8336
В	3648	9999	K	5065	13587

Н	2266	6524	Total	56162	157617

Table 1. The Overview of Lancaster Parsed Corpus

### **4** The Constrained Grammar

A Constrained Grammar is extracted from the Lancaster Parsed Corpus. Because the chunking and raising actions are applied only once in the preliminary experiment, only those rules that appear on the lowest level of the parsing trees form a Constrained Grammar.

#### Fig. 3. The Parsing Tree

Consider a sentence "Northern Rhodesia is a member the federation .". Its parsing tree is shown in Fig. 3. Three constrained rules shown below are extracted from this parsing tree.

(\*) NP NP (BEZ) -> N

(NP) BEZ (ATI) -> V

(INO) ATI NN (.) -> N

Two constraints enclosed in parentheses, i.e., the left and the right constraints, are added into each constrained rule. For example, the constrained rule, (NP) BEZ (ATI)  $\rightarrow$  V, has the left constraint NP and the right constraint ATI. It means that chunk [BEZ] can be raised to V when its left tag is NP and its right tag is ATI. The other two rules have the similar interpretations. The asterisk marks the beginning of the sentence. A more complicated example is given as follows:

[S[N a\_AT move\_NN [Ti[Vi to\_TO stop\_VB Vi][N \0Mr\_NPT Gaitskell\_NP N][P from\_IN [Tg[Vg nominating\_VBG Vg][N any\_DTI more\_AP labour\_NN life\_NN peers\_NNS N]Tg]P]Ti]N][V is\_BEZ V][Ti[Vi to\_TO be\_BE made\_VBN Vi][P at\_IN [N a\_AT meeting\_NN [Po of\_INO [N labour\_NN \0MPs\_NPTS N]Po]N]P][N tomorrow\_NR N]Ti] ... S]

The following constrained rules are extracted from this example:

 (NN) TO VB (NPT) -> Vi
 (VB) NPT NP (IN) -> N

 (IN) VBG (DTI) ->Vg
 (VBG) DTI AP NN NN NNS (BEZ) -> N

 (NNS) BEZ (TO) -> V
 (BEZ) TO BE VBN (IN) -> Vi

 (INO) NN NPTS (NR) -> N
 (NPTS) NR (.) -> N

Furthermore, the same constrained rules are grouped into one. Under this way, total 20,002 constrained rules are extracted from the Lancaster Parsed Corpus. All the constrained rules are examined and 219 conflict rules are found. The conflicts result from the inconsistent annotations in the corpus. Some conflict rules are listed below. The number enclosed in the parentheses denotes the frequency of the rule.

(NNS) VB (ATI) -> V (6), Vr (1) (NNS) VB (IN) -> V (24), Vr (1)

(NNS) VBN (.) -> Vn (10), Vr (1) (NNS) VBN (IN) -> Vn (54), V (3)

(NNS) VBN (RB) -> Vn (4), V (1)

In the above samples. (NNS) VB (ATI) -> V (6), Vr (1), means that VB can be raised to V (Vr) with frequency 6 (1). To avoid this inconsistency, some rules having lower frequencies are deleted. Finally, a decision tree is used to model the remaining unconflict rules. Fig. 4 shows the decision tree for the following rules:

 $(DT) BEDZ(WDT) \rightarrow V (DT) BEDZ(WRB) \rightarrow V (DT) BEG(PN) \rightarrow Vg$  $(DT) BEZ(.) \rightarrow V (DT) BEZ(ABL) \rightarrow V (DT) BEZ(ABN) \rightarrow V$ 

A rule can be applied when its left constraints, chunks and its right constraints are satisfied. That is, a path is found in the decision tree.

## **5** The Partial Parsing Algorithm

The partial parsing algorithm based on Constrained Grammar is proposed below.

Begin C_Position=1; While C_Position<=N Do Begin Find=0; For Chunk_Length=8,, 1 Do Begin If (C_Position+Chunk_Length-1)<=N Then Begin If Search Decision Tree for Tag_Sequence[C_Position-1] as Left Constraint, Tag_Sequence[C_Position-(C_Position+Chunk_Length-1)] as Chunk and Tag_Sequence[C_Position+J] as Right Constraint Is Successful Then Begin Output "["; Output Raised Tag; For Position=C_Position,, (C_Position+Chunk_Length-1) Do Output Tag_Sequence[Position]; Output Tag_Sequence[Position]; Output Tag_Sequence[Position]; Output Tag_Sequence[Position]; Output "]"; Find=1; Goto Done; End End End End End End End End	Partial_Parser(Tag_Sequence)					
C_Position=1; While C_Position<=N Do Begin Find=0; For Chunk_Length=8,, 1 Do Begin If (C_Position+Chunk_Length-1)<=N Then Begin If Search Decision Tree for Tag_Sequence[C_Position-1] as Left Constraint, Tag_Sequence[C_Position-(C_Position+Chunk_Length-1)] as Chunk and Tag_Sequence[C_Position-(C_Position+Chunk_Length-1)] as Chunk and Tag_Sequence[C_Position+J] as Right Constraint Is Successful Then Begin Output "["; Output Raised Tag; For Position=C_Position,, (C_Position+Chunk_Length-1) Do Output Tag_Sequence[Position]; Output Raised Tag; For Dostion=C_Position]; Output Tag_Sequence[Position]; Output Tag_Sequence[Position]; Contput "]"; Find=1; Goto Done; End End Done: If Find=1 Then C_Position=C_Position+Chunk_Length-1; Else Output Tag_Sequence[C_Position]; C_Position=C_	Begin					
<pre>Begin Find=0; For Chunk_Length=8,, 1 Do Begin If (C_Position+Chunk_Length-1)&lt;=N Then Begin If Search Decision Tree for Tag_Sequence[C_Position-1] as Left Constraint, Tag_Sequence[C_Position-(C_Position+Chunk_Length-1)] as Chunk and Tag_Sequence[C_Position+J] as Right Constraint Is Successful Then Begin Output "["; Output Raised Tag; For Position=C_Position,, (C_Position+Chunk_Length-1) Do Output Tag_Sequence[Position]; Output Raised Tag; Find=1; Goto Done; End End Done: If Find=1 Then C_Position=C_Position+Chunk_Length-1; Else Output Tag_Sequence[C_Position]; C_Position=C_Position]; </pre>						
<pre>Find=0; For Chunk_Length=8,, 1 Do Begin If (C_Position+Chunk_Length-1)&lt;=N Then Begin If Search Decision Tree for Tag_Sequence[C_Position-1] as Left Constraint, Tag_Sequence[C_Position-(C_Position+Chunk_Length-1)] as Chunk and Tag_Sequence[C_Position+J] as Right Constraint Is Successful Then Begin Output "["; Output Raised Tag; For Position=C_Position,, (C_Position+Chunk_Length-1) Do Output Tag_Sequence[Position]; Output Raised Tag; Output "]"; Find=1; Goto Done; End End Done: If Find=1 Then C_Position=C_Position+Chunk_Length-1; Else Output Tag_Sequence[C_Position]; C_Position=C_Position]; </pre>	-

Output Raised Tag; Output "]"; Find=1; Goto Done; End End Done: If Find=1 Then C_Position=C_Position+Chunk_Length-1; Else Output Tag_Sequence[C_Position]; C_Position=C_Position+1;						
Output "]"; Find=1; Goto Done; End End End Done: If Find=1 Then C_Position=C_Position+Chunk_Length-1; Else Output Tag_Sequence[C_Position]; C_Position=C_Position+1;						
Find=1; Goto Done; End End End Done: If Find=1 Then C_Position=C_Position+Chunk_Length-1; Else Output Tag_Sequence[C_Position]; C_Position=C_Position+1;						
Goto Done; End End End Done: If Find=1 Then C_Position=C_Position+Chunk_Length-1; Else Output Tag_Sequence[C_Position]; C_Position=C_Position+1;						
End End Done: If Find=1 Then C_Position=C_Position+Chunk_Length-1; Else Output Tag_Sequence[C_Position]; C_Position=C_Position+1;						
End End Done: If Find=1 Then C_Position=C_Position+Chunk_Length-1; Else Output Tag_Sequence[C_Position]; C_Position=C_Position+1;						
End Done: If Find=1 Then C_Position=C_Position+Chunk_Length-1; Else Output Tag_Sequence[C_Position]; C_Position=C_Position+1;						
Done: If Find=1 Then C_Position=C_Position+Chunk_Length-1; Else Output Tag_Sequence[C_Position]; C_Position=C_Position+1;						
<b>Else</b> Output Tag_Sequence[C_Position]; C_Position=C_Position+1;	End					
<b>Else</b> Output Tag_Sequence[C_Position]; C_Position=C_Position+1;	Done If Find=1 Then C Position=C Position+Chunk Length_1					
C_Position=C_Position+1;						
2/11/4						
End	End					

Variable *Find* denotes whether a chunk is found in the decision tree or not and Variable *C\_Position* means current position. Assume that the input sentence contains N words, and the symbol \* is added to the beginning position (0) and the ending position (N+1) to facilitate the process. The processes for N=6, C\_Position=1 and Chunk\_Length=8 (7 and 6) are shown in Fig. 5.

Because the length of the largest chunk in the training corpus is 8 and the larger chunks are preferred, the algorithm checks the chunks from length 8 to 1.

### 6 The Experimental Results

The performance evaluation model compares the chunking-and-raising result P' with the corresponding syntactic structure T. The evaluation criterion is to count how many tags are assigned correctly. For example, there is a parsing tree - say, [A [ B [  $C W1_P1 W2_P2 C$  ]  $W3_P3$  [  $D W4_P4 D$  ] B ] [  $E W5_P5 W6_P6 E$  ] A ]. If the parsing result is [  $F W1_P1 W2_P2 F$  ] [  $G W3_P3 G$  ]  $W4_P4$  [  $E W5_P5 W6_P6 E$  ], then 2 tags, i.e., P5 and P6, are assigned correctly. The tags P1 and P2 are wrong because the raised tag is wrong, i.e., it must be C. The tag P3 is wrong because P3 cannot be a chunk. Similarly, the tag P4 is wrong because it must be chunked and raised to D. According to this criterion, the experimental results are shown in Table 2.

Category	Correct	Wrong	Total	Correct Rate (%)
Α	7792	492	8284	94.06%
В	8839	553	9392	94.11%
C	7183	555	7738	92.83%
D	9137	611	9748	93.73%
E	8658	614	9272	93.38%
F	7810	562	8372	93.29%
G	5794	472	6266	92.47%
Н	5872	652	6524	90.01%
J	7600	711	8311	91.45%
K	10338	463	10801	95.71%
L	11394	596	11990	95.03%
М	6958	369	7327	94.96%
N	11147	506	11653	95.66%
Р	11549	548	12097	95.47%
R	7878	502	8380	94.01%
Total	127949	8206	136155	93.97%

If the inconsistency problem of the corpus does not occur, the performance can be better. When we remove one file from training corpus and use this file as the testing corpus, the experimental results are listed in Table 3.

Table 3. The Experimental results for Outside Test

	Table 5. The Experimental results for Outside Test							
Category	Correct	Wrong	Total	Correct Rate (%)				
K	8324	2477	10801	77.07%				
Р	9366	2731	12097	77.42%				
N	9166	2487	11653	78.66%				

In these experiments, K, P or N are removed from training corpus. The performance is decreased. It reveals that the training corpus is still not large enough. Structure Mapping between different treebanks [19] provides a feasible way to obtain a larger corpus. In this way, much more reliable

statistic information can be trained from the large-scale treebanks, so that the feasibility of the parser is assured.

### 7 Related Works

Chen and Chen [20] propose a probabilistic chunker to decide the implicit boundaries of constituents and utilize the linguistic knowledge to extract the noun phrases by a finite state mechanism. Rather than using a treebank as a training corpus, Chen and Lee [21] also propose a probabilistic chunker based on parts-of-speech information only. However, the evaluation adopted in these two papers is not very strict. Consider the following parsed sentence, which is extracted from Susanne Corpus.

[ S [ Nns:s The\_ATI [ Nns Fulton\_NP County\_NPL Nns ] Grand\_JJ Jury\_NN Nns:s ] [ Vd said\_VBD Vd ] [Nns:t Friday\_NR Nns:t ] [ Fn:o [ Ns:s an\_AT investigation\_NN [ Po of IN [ Ns [ G Atlanta's\_NP\$ G ] recent\_JJ primary\_JJ election\_NN Ns ] Po ] Ns:s ] [ Vd produced\_VBD Vd ] [ Ns:o +no\_ATI evidence\_NN [ Fn that\_CS [ Np:s any\_DTI irregularities\_NNS Np:s ] [ Vd took\_VBD Vd ] [Ns:o place\_NPL Ns:o ] Fn ] Ns:o ] Fn:o ] S ]

By the method proposed by Chen and Chen [20], the result is shown as follows.

[ The\_ATI Fulton\_NP County\_NPL ] [ Grand\_JJ Jury\_NN ] [ said\_VBD ] [ Friday\_NR ] [ an\_AT investigation\_NN ] [ of\_IN Atlanta's\_NP\$ ] [ recent\_JJ primary\_JJ election\_NN ] [ produced\_VBD ] [ +no\_ATI evidence\_NN ] [ that\_CS any\_DTI irregularities\_NNS ] [ took\_VBD ] [ place\_NPL ]

By their evaluation criterion, only chunk [ of\_IN Atlanta's\_NP\$ ] is wrong. But, it is clear that some chunks are wrong. By our criterion, the correct output should be:

The\_ATI [ Nns Fulton\_NP County\_NPL Nns ] Grand\_JJ Jury\_NN [ Vd said\_VBD Vd ] [ Nns:t Friday\_NR Nns:t ] an\_AT investigation\_NN of\_IN [ G Atlanta's\_NP\$ G ] recent\_JJ primary\_JJ election\_NN [ Vd produced\_VBD Vd ] +no\_ATI evidence\_NN that\_CS [ Np:s any\_DTI irregularities\_NNS Np:s ] [ Vd took\_VBD Vd ] [ Ns:o place\_NPL Ns:o ]

The key issue is: when the chunked results are erroneous on the lowest level, the effects will be propagated to the upper level. Besides, the interpretation of chunks is another problem. Consider a sequence of chunks, i.e., [A] [BC] [D]. There may be at least two possible interpretations shown in Figs. 6 and 7. That makes the chunker difficult to scale up to a full parser.

Fig. 7. Interpretation 2

### 8 Concluding Remarks

This paper proposes a linear-time partial parser. It is a simple version of a chunking-and-raising parser, but it can be extended to a full parser easily by performing more chunking and raising actions. Basically, the Constrained Grammar is provided to each level of the chunking-and-raising parser. Because each rule in the Constrained Grammar has left and right constraints, the grammar is different from the LL(k) grammar although they have the similar concepts, i.e., left to right scanning and lookahead. In contrast to the Inside-Outside optimization algorithm [5] which is very computationally intensive, this kind of parser is very simple but effective. The short-term goal of this research is to help the development of a partially bracketed corpus, i.e., a simpler version of a treebank. The long-term goal is to provide high level linguistic constraints for many natural language applications.
