fine translation tools

MCB Systems will be exhibiting the TRADOS Translator's Workbench translation memory system and explaining options for integrating it with leading machine translation systems.

The TRADOS Translator's Workbench for Windows is not a machine translation program. Rather, it stores translation work at the sentence level, and is able to "recycle" any sentences that are repeated later. While a translation memory approach requires very little post-editing, it does require new text to be translated from scratch. Machine translation, on the other hand, provides fast translations of new text, but the translations require post-editing. A good approach to getting fast, accurate translation from the computer is to integrate the two systems.

The example below shows the Workbench, at the top of the screen, being used with Microsoft Word. A 100% match has been found in translation memory. Come see a live demonstration!
