QTLaunchPad is a two-year European Commission-funded project whose aim is to identify and overcome the barriers to high-quality translation by means of the collaborative development of translation quality assessment and estimation technologies. Through inclusive community engagement and mobilisation with translator and user groups such as GALA and FIT, as well as LSPs and localisation buyers and vendors, the project has been preparing a large-scale research and innovation initiative, QT21, for a major push in high-quality translation technology to be implemented as a project cluster in the upcoming EC funding schemes Horizon 2020 and CEF.
