```

In both Full vs ZeroMI (`fvz`) and Nonzero vs ZeroMI (`nvz`) settings, the configuration has significant effects on the test accuracy.

LMM with random effects

```
model_fvn_re <- lmer(test_acc ~ task + model + config + (1+config|rs), data=df_fvn)
```

```
## boundary (singular) fit: see ?isSingular
```

```
anova(model_fvn_re)
```

```
## Type III Analysis of Variance Table with Satterthwaite's method
##           Sum Sq Mean Sq NumDF DenDF  F value Pr(>F)
## task    30.8118  0.40015     77  5375 230.6586 <2e-16 ***
## model     3.8915  0.64859      6  5375 373.8626 <2e-16 ***
## config    0.0000  0.00000      1  5375   0.0005 0.9814
## ---
## Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1
```

When considering the random effects of the seeds, the config still has no effects.
