

Low-cost information retrieval packages

Forbes Gibb

*Lecturer, Department of Information Science, University of
Strathclyde*

At the Translating and the Computer conference Forbes Gibb presented a paper on the storage and retrieval of information. He discussed areas in which such techniques could assist the translator in his or her work. Client records, bibliographic (subject) references, translation records, dictionaries and translator directories are among some of the potential application areas. The speaker reviewed the basic principles involved in information retrieval and provided guidelines for selecting, installing and getting the most out of appropriate software packages.

Unfortunately, due to unavoidable circumstances, this paper could not be included in the Proceedings. Readers who would like further information can contact the speaker at the address below.
